"Mosliklar", "Iqtibos keltirishlar", "O'z-o'zidan iqtibos keltirishlar", "Originallik" alohida ko'rsatkichlar bo'lib, foiz sifatida ko'rsatiladi va 100% gacha qo'shiladi, bu tekshirilayotgan hujjatning to'liq matniga mos keladi.

Tekshirildi: 87,99% hujjat matni, chekdan chiqarib tashlang: 12,01% hujjat matni. Foydalanuvchi tomonidan o'chirib qo'yilgan bo'limlar va elementlar: Titul varaqasi, Bibliography, Ilova, Tables

- Mosliklar** — tekshirilayotgan matnning topilgan manbalarga to'liq yoki qisman o'xshash qismlari, tizim iqtibos yoki o'z-o'zidan iqtibos keltirishlar qismlari bundan mustasno. "Mosliklar" ko'rsatkichi – bu tekshirilgan matnning umumiy matn hajmidagi mos deb tasniflangan qismlarining ulushi.
- O'z-o'zidan iqtibos keltirishlar** — bu tekshirilayotgan matnning muallifi yoki hammuallifi tekshirilayotgan hujjatning muallifi bo'lgan manba matnining bir qismiga to'g'ri keladigan yoki deyarli mos keladigan qismlari. "Iqtibos keltirish" ko'rsatkichi – bu matnning umumiy hajmidagi iqtibosga kiritilgan, tekshirilgan matn qismlarining ulushi.
- Iqtibos keltirish** — tekshirilayotgan matnning muallifga tegishli bo'lmagan, lekin tizim to'g'ri formatlangan deb tasniflaydigan qismlari. Iqtiboslar andozali iboralarni ham o'z ichiga oladi; bibliografiya; "SPS GARANT: me'yoriy-huquqiy hujjatlar" qidirish moduli tomonidan topilgan matn qismlari. "Iqtibos keltirish" ko'rsatkichi – bu matnning umumiy hajmidagi iqtibosga kiritilgan, tekshirilgan matn qismlarining ulushi.
- Matnli kesishma** — tekshirilayotgan hujjatdagi manba matni fragmenti bilan ustma-ust yoki deyarli ustma-ust tushuvchi matn fragmenti.
- Manba** — bu tizimda indekslangan va tekshirilayotgan qidirish modulida joylashgan hujjat.
- Original matn** — tekshirilayotgan matnning hech qanday manbada topilmagan va qidirish modullarining birortasi tomonidan belgilanmagan qismlari. "Originallik" ko'rsatkichi - tekshirilayotgan matnning original matnga tegishli qismlarining matnning umumiy hajmidagi ulushi.

E'tiboringizni tizim tekshirilayotgan hujjatning tizimda indekslangan matnli manbalar bilan mos kelishlarni topishiga qaratamiz. Bunda tizim yordamchi vosita hisoblanadi, o'zlashtirib olishlar yoki iqtibos keltirishlarning to'g'riligi va o'rinaliligini hamda tekshirilayotgan hujjat matnli fragmentlarining muallifi kimligini aniqlash tekshiruvchining vakolatida qoladi.

INTRODUCTION (Doctor of Philosophy (PhD) dissertation)

The relevance and necessity of the dissertation topic. Various forms of developing students' creative activities and creative mechanisms have been implemented in practice around the world . International organizations and developed countries pay special attention to the development of didactics and teaching activities, the activation of an effective competency- based approach in managing the activities of creative educational institutions . In the international education concept established by UNESCO until 2030, it is stated that “Quality education stimulates creative thinking and knowledge, develops the foundations of literacy and numeracy skills, as well as analysis, problem-solving, reasoning and other interpersonal skills. and social skills at a high level ¹. Internationally, there is a need to improve the quality of education, develop creative thinking, critical thinking, self - assessment, and the creative activity of students , especially in our country , which has been operating since 2019 . Special attention is being paid to the technology of educating gifted students and developing their creativity in creative and specialized schools .

In the world of education , a number of scientific researches are being conducted based on the principles of continuity, continuity and consistency, in order to discover teaching models in harmony with the ideas of technological progress, and to implement the leading ideas of the theory and methodology of educational quality. In this process, new approaches to the principles of developing students' creative activity, scientific and pedagogical innovations, the development of individualized teaching technologies aimed at developing a scientific worldview in students based on the "STEAM - education" program of education , and ensuring the compatibility and viability of completely different theoretical knowledge with practice in the educational process in accordance with the requirements of international assessment programs such as PISA, TIMSS, PIRLS, have not only gained importance, but also

¹ Incheon Declaration/Education 2030: Towards inclusive and equitable quality education and lifelong learning for all (Word Education Forum, May 19-22, 2015, I-ncheon, Republic of Korea ¹)

proved to be fundamental . Finding solutions to the problems of students' creative activity in the system of educational institutions, organizing the creative activities of students, and effectively managing the education system consists in developing the personality of students from school age, educating their abilities, moral and aesthetic feelings on the basis of national values, developing their interest in learning, their desire and desire, their emotional attitude to themselves and the world around them, and their spiritual world. Since it has become an urgent issue to pay special attention to the technology of targeted education of gifted students, which contributes to the realization of the intellectual abilities of a creative student, the rational use of his internal capabilities, and the development of their creativity, as well as to the implementation of scientific research aimed at pedagogical technologies in order to improve the functioning of the system, this scientific study was called "**Management technology for the development of creativity of gifted children in Uzbekistan**"¹ . In the current era, conceptual scientific research focused on creative activity in education, which focuses on the development of talent in creative students, their interest in invention, their rapid perception of the figurative content of fairy tales, stories, songs, and music based on universal human values, and their creative potential, have become a great need for the national education system.

Reforms to bring the education system to a new qualitative stage in the new Uzbekistan are not only creating the necessary conditions for students to master modern knowledge on the basics of science, starting from school education, developing spiritual and moral qualities based on basic national and universal values, labor skills, creative thinking and a conscious attitude to the environment,³⁷ but also creating the need to improve effective pedagogical approaches to organizing the creative activities of students.¹⁸ The Concept for the Development of the Public Education System until 2030 sets out such important tasks as “improving teaching methods, gradually introducing the principles of individualization into the educational process, and developing healthy, strong and effective motivation for

learning in students from an early age ².” There is a special need for the development of students' creative activities, targeted research taking into account their age characteristics, and effective management, which is why our country pays sufficient attention to this area. This approach involves developing the upbringing and creativity of students in education, as well as improving the technology of targeted education for them, the effective principle of creative activity of students studying in it. This can be achieved by developing the creative activity of students in creative schools and organizing the educational process based on teacher-student interaction, improving control strategies, and developing modern management mechanisms.

of foreign scholars such as A. Marshall, ¹⁶M. Porter, O. Solwell, G. Lindqvist, C. Ketels, ¹⁷the economic aspects of student education and creativity in science and their effective management have been studied as a phenomenon related to the interaction of several elements of management and their unification around a single goal.

The development of students' educational and cognitive activity was studied in the context of problem-based education. IPVolkov, IVDorno, RIIBragimov, VVMatkin, MIMakhmutov ¹⁸and others studied the issues of creative organization of education from the perspective of problem-based education. A number of studies have highlighted the psychological problems of student education and development of creativity: NFTalizina's works comprehensively covered the creative and psychological problems of students' mastery at different stages of the educational process; AMMatyushkin, Ya.A.Ponomaryov ¹⁹analyzed some problems in the student's worldview in the development of creativity in students through the development of knowledge, skills, and abilities to work with information.

In the studies of F.Ya.Baykov, LAVenger and ALVenger, students' upbringing and creativity, intuition, discursive thinking were analyzed in the system of "action and thought". ²⁰In the research of Ya.A.Ponomaryov, students' upbringing and creativity in educational conditions were distinguished as a complex psychological phenomenon.

reveal some elements and aspects of the skills of using modern pedagogical technologies in developing students' creative activity in education, demonstrating

¹⁶ In the preparation of this Memoir I have had great assistance from Mrs. Marshall. I have to thank her for placing at my disposal a number of papers and for writing out some personal notes from which I have quoted freely. Alfred Marshall himself left in writing several autobiographical scraps, of which I have made the best use I could.

their skills in turning them into active participants in the educational process, and developing creative pedagogical thinking. However, The lack of special research on the management technology for developing the creativity of gifted students is the subject of this research work. It was named " **Management technology for developing the creativity of gifted children in Uzbekistan.**"

and plans of the higher education institution where the dissertation was completed . The dissertation research was carried out within the framework of the scientific and practical project PZ-2017-0927124 of the I. Karimov Tashkent State Technical University on the topic "Development of pedagogical activities based on cooperation in educational institutions" (2021-2023).

The purpose of the study is to develop proposals and recommendations for improving the management technology for developing the creativity of gifted children in Uzbekistan.

Objectives of the study:

clarifying the pedagogical components of improving the quality of education through management technology for developing the creativity of gifted children;

developing an innovative model of pedagogical education through the development of creativity in gifted children;

improving the theoretical foundations of ensuring the quality of integrated education in science, education and production through the management technology of developing the creativity of gifted children as a scientific and pedagogical problem;

development of scientific-theoretical, methodological and recommendations based on the technology for developing the creativity of gifted children.

The object of the study was the process of developing the creativity of gifted children, and a total of 432 students in grades VII-IX from the Erkin Vohidov creative schools in Fergana region, Halima Khudoyberdiyeva creative schools in Syrdarya region, and a specialized educational institution in Zangiota district of Tashkent region participated in the experimental work.

The subject of the research is the content, form, methods and tools of management technology for the development of creativity in gifted children.

Research methods. The research used such methods as theoretical (analytical-statistical, comparative comparison, generalization, interpretation), diagnostic (interview, questionnaire, observation, classification), mathematical and pedagogical experiment (mathematical-statistical processing of data, graphical representation of results, modeling, etc.).

The scientific novelty of the study is as follows:

The pedagogical components of the educational process aimed at developing the creativity of gifted children are clarified based on the individual approach, creative pedagogical strategies, and adaptation to competency requirements through qualitative criteria, mechanisms for assessing the level of student competence and implementing indicators for determining talent;

The innovative pedagogical model for developing the creativity of gifted children is developed on the basis of a comprehensive systematization of the mechanism for the gradual development of interconnected structural sections of types of education in accordance with the principles of horizontal and vertical integration and coherence, as well as a competency-based approach, based on scientific and methodological foundations;

The theoretical foundations of the development of creativity in gifted children as a scientific and pedagogical problem have been improved through the pedagogical design of heuristic, inductive-deductive and methodological components of a mobile rapid communication mechanism based on coherence, systematicity, stability, and synergistic flexibility to improve the quality of education in specialized schools, based on an innovative and modular approach;

Practical mechanisms for developing the creativity of gifted children have been improved based on the development of a concept of contextual-modular integration, synergistic harmony of transversal competencies, and the gradual development of an adaptive-reflexive management system in accordance with innovative-pedagogical paradigms and scientific-methodological requirements.

The practical results of the research are as follows:

Management technology for developing the creative abilities of gifted children in the educational process in specialized schools issues of improving the educational system and ensuring the necessary pedagogical components at the appropriate level in the management activities of the education system The textbook "Pedagogical technology, its definitions and the concept of professional skills" is covered in a series of scientific articles and theses on the topic " Education and development of creativity of gifted students ";

Recommendations have been developed to improve the quality of education in specialized schools, that is, to improve the "school of creativity - laboratory of talent" ;

A professionally oriented model didactic support (textbook, recommendations) has been created based on a model for managing and developing the creativity of gifted children ;

Social order cooperation programs and modern technologies have been developed based on inter-system interests to improve the quality of education in specialized schools .

The reliability of the research results is determined by the methodology of the theory of knowledge: behaviorism and cognitive, knowing, understanding, understanding and thinking, as well as the work of scientists and practitioners of the republic and foreign countries in the field of pedagogical education; the use of research methods that are consistent with the research objectives and complement each other; the analysis of experimental work and the quantitative and qualitative provision of research results.

Scientific and practical significance of the research results. The scientific significance of the search is explained by the fact that the factors ensuring the effectiveness of the quality of education in specialized schools were scientifically and theoretically analyzed, the development of life skills of gifted children and effective pedagogical and technological components were clarified, the systematic and organizational tasks of subject-subject cooperation and modern technologies for improving the quality of education in creative schools, principles, practical

recommendations and enriched programs, projects, recommended materials and the development of an “ Innovative Model of Pedagogical Education” on scientific and theoretical problems relevant to the field.

The practical significance of the research is based on the concept of contextual-modular integration of practical mechanisms for developing the creativity of gifted children based on technologies for improving the quality of education in specialized schools , synergistic harmony of transversal competencies, and *the gradual development of an adaptive-reflexive management system* in accordance with *innovative-pedagogical paradigms* and *scientific-methodological requirements*. It is determined by the creation of textbooks and an innovative model of pedagogical education, the development of materials such as scientific and methodological proposals and recommendations based on research results to identify and develop student talents and, accordingly, direct them to the right profession.

Implementation of research results . Based on the results of research conducted in educational institutions on improving the quality of education in specialized schools, the following are recommended:

The mechanisms for assessing the level of student competence and implementing indicators for determining talent based on the pedagogical components of the educational process aimed at developing the creativity of gifted children were improved, and scientific methodological proposals and recommendations based on an individual approach, creative pedagogical strategies, adaptation to competency requirements through qualitative criteria, and integration of the requirements of national educational standards were used in the implementation of the practical project PZ-2017927124 “Development of pedagogical activity based on cooperation in educational institutions”. As a result, an increase in the quality and efficiency of educational processes in specialized educational institutions was achieved;

in interconnected structural divisions of educational types is based on the complex systematization of the mechanism for the gradual development of interconnected structural divisions of educational types in accordance with the principles of horizontal and vertical integration and coherence, as well as the competency-based approach, based on scientific and methodological foundations. The proposals and recommendations were used in the implementation of the practical project No. A1-XT-092997 of the Karakalpakstan branch of the National Institute of Educational Pedagogy named after Qori Niyazi of the Ministry of Preschool and School Education of the Republic of Uzbekistan on the topic “Problems of spiritual and moral education of young people based on the harmony of universal, national and historical values” . (Reference No. 579 of the Karakalpakstan

branch of the National Institute of Educational Pedagogy named after Qori Niyazi of the Ministry of Preschool and School Education of the Republic of Uzbekistan dated December 26, 2024). As a result, the organization of cooperation between educational institutions and the creative professional competence of teachers have been improved;

are an innovative-modular approach to improving the quality of education in specialized schools, based on coherence, systematicity, stability, and synergistic flexibility, using heuristic, inductive-deductive, and methodological components of a mobile rapid communication mechanism *used to increase the priority of pedagogical design based on* (Act of the Ministry of Preschool and School Education of the Republic of Uzbekistan No. 189 dated December 27, 2021 on its introduction into practice in specialized schools).

Approbation of research results . The results of this research were discussed at 5 international and 3 republican scientific and practical conferences.

Publication of research results. A total of 15 scientific works on the research topic, including 1 textbook, 6 scientific articles in scientific publications recommended for publication of the main scientific results of doctoral dissertations by the Higher Attestation Commission under the Ministry of Higher Education, Science and Innovation of the Republic of Uzbekistan, including 3 in national and 5 in foreign journals.

Structure and size of the dissertation. The dissertation consists of an introduction, three chapters, conclusions and recommendations, a list of references, and appendices. The main volume of the dissertation is 161 pages.

CHAPTER I. SCIENTIFIC AND THEORETICAL BASIS OF MANAGEMENT TECHNOLOGY FOR DEVELOPING CREATIVITY OF GIFTED CHILDREN IN UZBEKISTAN

§ 1.1. Formation and management of students' creative activity in schools of Uzbekistan - as a pedagogical problem

In today's rapidly changing world, a competitive education system is essential. development the most important from factors one modern education environment is considered to be the creation of such an educational environment, which will lead to high increasing the number of intellectually talented personnel, school teachers' professional development competence and improvement of teaching quality and management skills of school leaders to improve the efficiency of activities help Modern education Developing the system and implementing innovative technologies into it is a new way of management. necessary methods in practice hand ability has It depends on the leading teachers .

In our republic last in years science and technology and education development to provide big attention is being addressed. Our country education The main goal of changes in the education system is to bring a clear positive content to the educational process. giving, development and management of creative activities of schoolchildren based on future generation to develop into all-round mature individuals, to develop their logical thinking , spiritual and moral values and worldview to develop aimed at nationwide politics done is to increase.

Today, the development and management of students' creative activities in schools of the republic is considered a scientific and pedagogical problem. Our President Sh. Mirziyoyev emphasizing as they have in the past, "...fair" social politics quality management, which is considered the most important factor in developing human capital education issue from this since also permanent our attention in the center will be.

We need modern science to lay the foundation for the Third Renaissance in our country. and again one there is science, upbringing and again one there is upbringing necessary. Today and tomorrow our day, our young generations fate solution to do high qualified teacher and coaches, professors, teachers, real intellectuals need..." [1].

Latest in years republic economy networks innovative development of the social sphere, science and scientific activity, and public education one-sided support and effectiveness increase according to clear to the goal directed measures done increased. Democratic implementation of reforms, including the development and management of students' creative activities in schools, human rights and freedoms and undertake extensive work to ensure the rule of law. However, the large-scale reforms being implemented at the modern stage of the country's development are in the field of science and innovation. Improving public administration mechanisms, promoting scientific activities increasing transparency in the development of government programs related to scientific achievements and innovation in economic sectors and regions technologies current to grow their work acceleration necessary shows [1].

2020 - year 23 - in September acceptance made Education about law, The President of the Republic of Uzbekistan, dated September 5, 2018, issued a statement on the "People's education to the system management new principles current to grow Resolution No. PQ-3931 "On measures to combat the spread of the coronavirus", dated September 5, 2018 "Additional measures to improve the public education management system" Decree No. PF-5538 "On measures to improve the public education system", approved by Decree No. PF-5712 of April 29, 2019 2030-until the year develop Concept", 2020 - year 6- in November "Uzbekistan's new progress during education and science areas develop measures "about" Decree No. PF-6108, as well as the resolution and other important tasks set forth in regulatory legal acts, to develop and manage the creative activities of students in schools determines the relevance of researching the organizational and methodological foundations of innovation management activities in their professional development. In order to ensure the implementation of the tasks set out in the above regulatory documents, our research work is aimed at developing and managing the creative activities of students in schools. serves a certain extent.

Humanity in society Human activity is a necessary condition for its development, a person gains life experience, perceives the world around him, absorbs knowledge, forms knowledge, skills and abilities. The introduction of modern techniques and technologies into life in the present era indicates that there

will be major changes in human activity and social consciousness . After all, a person and ideas about the world have changed , new ways of understanding human thought and the world have been formed , and a transition to new means and methodologies of spiritual and practical mastery has taken place. It is possible .

Education in institutions development and management of students' creative activities the main factors determining its effective educational activity factor The student 's Theoretical and scientific concepts form the pedagogical basis of heuristic education. organization The cognitive process in schoolchildren occurs as a result of creativity. Research has shown that practice In order for creative activity to manifest itself in the process , there is a need for purposeful, planned, norm-oriented, and self-aware activity . This The practice of students mastering environmental objects and knowledge about them; ⁹ creating educational effectiveness requires relying on previous types of activity . In the process of directed education , his mental, intellectual, and creative qualities are manifested. In this regard, especially continuous education academic knowledge to master directed The opportunities for developing creative activity are ²³ broader at this stage . The first school During this period, students' mental abilities, attention, and thinking level develop quite actively. A number of psychologists and pedagogical scientists: AV Petrovsky, BMTeplov, VA Krutesky, E. Gaziyeu, G. Shoumarov, O. Rozikov, B. Adizov emphasize that during this period, under the influence of educational activities, students' mental activity, attention, memory, level of perception, thinking, and emotions develop. Since the creative activities of students of this age differ from each other, their talents also manifest themselves differently. Therefore, the inclinations and aspirations of primary school students in developing their cognitive and creative activities and talents are of great importance. Today, educational reforms being implemented due to independence depend on the training of ⁵ highly qualified personnel who have a creative approach to their work and contribute to the rapid development of science, technology, art, and production. ⁵ Accordingly, it is important and necessary to educate every student in the spirit of creativity, based on the requirements of social development [11].

If we pay attention, in traditional schools the methods, tools, and principles of ¹ scientific research have been defined and refined to a certain extent, while in

1 specialized and creative schools the research methods and tools used in the development and management of students' creative activity have not been sufficiently studied as an object of research, and the principles of their identification and implementation have not been fully analyzed. The scientific and pedagogical problem of the mechanisms for the development and management of students' creative activity in such schools is the problem of the relevance of students' creative activity - the description of knowledge, empirical views through categories such as "education", "creative activity", "management", "talent" requires a transition "from essence to reality", "from reality to essence". In this regard, the transition from essence to reality means moving from existing knowledge and experience in the development and management of creative activities of gifted schoolchildren to new knowledge, improved experience in further developing the creative activities of schoolchildren. From this instruction, we propose a transition from technology to essence in the development of students' abilities in education for the development and management of creative activities of students in specialized and creative schools, in which new experimental features, used and implemented technologies, methods, tools, and principles that are observed raise education to a new level and create the possibility of systematic management.

Research and experiments show that, in our opinion, creativity and creative activity are not only activators of students, but also educational institutions where such creative, talented school students study need a new, completely original and practically valuable educational process, developed and implemented under the leadership of a broad manager with management capabilities.

in specialized schools differs from that in schools under the current general education management. In this case, a number of problematic and important questions, such as the creative activity of schoolchildren, the composition of mastery, management technologies, their role in pedagogical practice, and their solution, serve as the scientific basis for the study of this topic.

The problem of developing and managing the creative activity of schoolchildren is an organizational system and has a number of its own qualities: first of all, in specialized, creative schools, the systematic management of students' creative activity is inextricably linked with research conducted in the field of

didactics and special methodological disciplines. In addition, interest in the content of education, the acquisition of knowledge is inextricably linked with the feeling of satisfaction of schoolchildren with the results of their own intellectual labor. This feeling is manifested by the teacher's encouragement and forms the desire, desire and need for students to work more effectively.

The gradual development of students' creative activity and the management of an educational institution as an organizational system depend on the teacher's willpower, theoretical and practical skills, knowledge acquired in the field, and experience gained in work.

specialized and creative schools, in order to continuously develop the creative activity and abilities of students, a system of studying educational materials, educational elements for each subject and subject are distinguished, and the real cognitive abilities of students are studied in a physiologically balanced manner. On this basis, the features of further improving the creative activity and abilities of students are identified, and the capabilities of the educational institution are developed.

The development and management of students' creative activity is a general future strategy reflecting the pedagogical process based on the social and pedagogical goals of education. This process is carried out gradually, systematically and purposefully. In our country, in schools aimed at educating such creative, talented students, curriculum, programs, textbooks, methodological recommendations and other teaching aids serve as an important resource. A full understanding of the pedagogical situation and a clear and correct definition of tasks are important conditions for the effective solution of the pedagogical process.

specialized and creative schools and educating creative students, the pedagogical goal, preparation for organizing the pedagogical process, is important, and the pedagogical task is perceived as a practical result. The success of pedagogical activity in the teaching process is determined by the essence of various management technologies and tasks. The process of implementing the system depends on their understanding and acceptance, one way or another.

As is known, the tasks common to pedagogical activity are: (Figure 1.1.1) In this regard, special emphasis is placed on the management system of specialized and

creative schools . In particular, the activity of students in lessons, the time allocated to mastering a new topic, understanding the topic, supporting their independent understanding, feedback, and feedback are considered important. The main management is reflected in the activities of the teacher and, in some cases, the student.

Figure 1.1. The pedagogical goal in managing specialized schools and the structure of pedagogical tasks at the stage of preparation for its organization.

If the pedagogical situation and management process in specialized and creative schools are not properly organized and directed to a specific goal, then pedagogical goals and tasks will not be fully realized in this situation . Therefore , a teacher who begins his professional career in an educational institution must have a realistic and correct understanding of the pedagogical situation, have the ability to consistently set goals and objectives, and systematically develop his professional activity. In the process of working with creative students, there are situations when the teacher is not always right. Sometimes they choose the path that suits them and try to solve the pedagogical task immediately, as a result of which the intended goal is not achieved . However, in some cases, even experienced teachers do not pay attention to the correct understanding of the pedagogical situation . As a result, an imbalance in pedagogical activity and chaos in the system arise: the teacher, without thinking about whether he can ensure the achievement of pedagogical goals in his work, activates students, uses visual aids, or controls knowledge through various

creative tasks and methods. Each A science has its own system of basic concepts, laws, principles, and rules. It is this very fact that guarantees its recognition as a science.

The content and essence of science open giver main A concept is called a category.

In the lesson, a problem relevance and of the subject clear The definition creates an activity structure, including The teacher should pay attention to the following in management (Figure 1.1.2) :

- 1) scientific of hypotheses true thief the integrity of the system and its shape;
- 2) the reality of the tasks and research fitness for purpose ;
- 3) research methods i relatively creative and objective approaches ;
- 4) the physiology of respondents involved in the experimental work process , either gender, psychological and personal characteristics (girl, boy), as well as the correct and specific state of the laws of personality development ;
- 5) scientific research the results in advance to work and to announce its results;
- 6) research quality and guaranteed results .

Figure 1.2. Education in specialized schools structure.

Another imbalance in the pedagogical activity in this management process is that many educators replace their pedagogical duties with secondary, functional, and transient tasks and focus only on certain aspects, which does not justify itself in practice.

In the educational process, especially in pedagogy, main It has a system of categories, basic concepts, laws, scientific principles, and theoretical rules of science. It is this fact that is of great importance in its systematic development and guarantees its recognition.

We know that any science or subject the essence open giver the most important, main concept is called a category.

Pedagogy science basic education categories person maturity It shows the general essence of the processes aimed at the systematic development of his creative abilities, achieving efficiency in the integrity of education and upbringing. The

following can be considered as the main categories of education: *personality, upbringing, education (teaching, studying), activity, creativity, knowledge, skills, qualifications, competence, information, development, development*. The listed categories are important in the creative and comprehensive development of the personality of a young student.

Here, we will comment on the main categories and focus on those that are important for the creative student's activities:

Personality ²¹- a spiritually developed being, with personal characteristics and behaviors with from others separated standing, certain a social subject, a member of society, possessing behavior and worldview. Along with the influence of heredity, environment, and upbringing, the influence of activity on the development of a person is also extremely important. “The most important and common feature inherent in a person who maintains a constant relationship with society, who is aware of himself and coordinates his every action, is his activity.”

Education ²²- certain, clear and realistic goal and socio-historical experience. The process of comprehensively developing and nurturing the younger generation, shaping its consciousness, behavior, and worldview.[11.17.132.]

Education - ²³equipping students with theoretical knowledge, practical skills and competencies armament, activity competence content to deliver, their a gradual process aimed at developing cognitive skills and worldviews.[12. 18.134]

Activity – (from the Latin “actus” - action, “activus” - active) is a category that explains the manifestation of all the actions of a person in life,” emphasizes the Uzbek scientist VM Karimova [13.48]. That is why in psychology the problems of a person, his consciousness and self-awareness are described through his activity, participation in one or another type of activity and the qualities associated with its accomplishment.

Creativity is a creative approach to a reality through existing knowledge and feelings. “Creative activity,” says AM Matyushkin, “is a system associated with cognitive processes” [14.36]. A number of psychologists - NP Shcherba [56], VS

²¹ . Petrovsky. AV .General Psychology T.1992, p. 97-134.

²² R.Juraev and others. Dictionary of pedagogical terms. T., 2008.

²³ R.Juraev and others. Dictionary of pedagogical terms. T., Science . 2008 .

Yurkevich [41], Ye. L. Yakovleva [78]: “Creative activity is a process of actions that embody human activity. The student’s personality is formed precisely in the process of various activities” [111,23,46].

A.N. Leontiev ²⁴, the basic psychological theory of human activity and the activity-based approach to education embodies the following ideas and principles:

1. The methodological basis for activity arises and occurs as a result of the influence of the objective world, on the one hand, and the psyche on the brain, on the other.

2. The activation of mental influence - this occurs and takes place based on the needs of the subject.

3. The orientation of the subject to activity in the material world, practical activity itself, is embodied and develops in social relations.

4. Human activity depends on the socio-historical nature of the individual's psyche, and this process takes place and is manifested in social life itself.

5. In human activity, the psyche is understood as an internal activity. [13.34].

Summarizing the above analysis, we recommend the following idea:

Activity is a specific form of systematic activity , ²⁵guided by human consciousness and thinking, arising from the needs of the individual learner, and aimed at applying, changing, and improving acquired knowledge.

Knowledge -²⁶ in the mind and consciousness of a person concepts, generalizations, known A set of systematized scientific and theoretical data and information about existence, reflected in the form of images.

Skill - ²⁷person's certain activity organization enough to take ability and opportunity.

Qualification²⁸ - certain movement or activity of execution a certain form of automation .

²⁴ A. N. Leontiev . Discussion on problems of deyatelnosti // Deyatelnostnyy podkhod v psikologii: problemy i perspektivy. — M., 1990.

²⁵ R.Juraev and others. Dictionary of pedagogical terms. T., Science. 2008.

²⁶ That book.

²⁷ That book.

²⁸ That book.

Competence ²⁹- occupied knowledge, skill and qualifications daily and the ability to apply it in practice in professional activities .

Information³⁰ - education as a result customized and a practical set of systematized knowledge, acquired skills and competencies, and a embodied worldview .

Development ³¹- in person stable feature and adjectives The process of systematic content creation based on established requirements and standards .

Development ³²- any amount that is not evident in the physiological and intellectual growth of a person and quality changes the essence expression provider complex practical process .

The principles listed above come into contact with different related disciplines at each stage of development of a science and explain the essence of the science and help to explain its content . [18. 23.]

It is known that the essence of social education in life scientific in terms of justification known pedagogical of the event requires knowledge of the laws of manifestation in specific situations. In this regard, the phenomenon of pedagogical management in the management of specialized and creative schools and in the education of creative students has a complex structure, and in practice, it relies on the capabilities of a number of disciplines to fully understand its general essence. From this point of view, there is a close relationship between management pedagogy and the following disciplines, which are:

Philosophy - the dialectical features of the process of personality development in social life, time, space, specific pedagogical idea, look and teachings philosophical A process that allows for the analysis of issues such as: [18.17]

Ethics is the systematic development of personal spirituality, which includes the highest human qualities, values, moral mind and spiritual - educational culture in upbringing It plays a special role in the application of important theoretical ideas to the pedagogical process.[18.11]

²⁹ That book.

³⁰ That book.

³¹ That book.

³² That book.

Aesthetics - person by of beauty perception to be, him/her The desire to create also serves to identify important directions in the development and cultivation of aesthetic taste.[18.11]

Economy - establishing the activities of educational institutions, building educational buildings build, education modernize processes organization to grow and It serves to understand the economic aspects of issues such as equipping them with material and technical equipment and new technologies.[18.20]

Sociology is an educational process based on acquiring information about the content of social relations and the conditions for their organization. between the participants their relationship effective organization creates an opportunity for growth.[18.34]

Physiology - education in the process students physiological, It helps to learn the basics so that anatomical features can be taken into account.[18.16]

Hygiene - protecting the health of students, protecting them sexually right to develop theoretical and practical ideas presented [18.9]

Psychology - in person spiritual and moral, spiritual-intellectual, creates a basis for the formation of emotional-volitional qualities.[18.36]

History - the development of pedagogical science, the dynamics of educational processes, dialectical features in consideration to take, also, serves as a source for teaching historical experience to the younger generation.[18.33]

Cultural studies - in students humanity by created material and spiritual heritage and educational It serves to develop an idea of the foundations of culture and to instill in them cultural behavioral traits. [18.36.]

Medical sciences - the study of the correct physiological and anatomical development of a person to provide, his/her in the body manifestation happening A practical approach to eliminating certain deficiencies, as well as the study of the problems of teaching and educating students with disabilities, will help.[18.81]

The system of pedagogical sciences is aimed at ensuring the development of the individual, his intellectual, spiritual and moral and physical in terms of It is advisable to take into account different age periods, the specific aspects of each period, as well as the physiological and psychological state of the student in

achieving development. Therefore, the holistic pedagogical process is studied by pedagogical disciplines that form a certain group. They are:[18.40]

General pedagogy - pedagogy conceptual issues and studies its practical aspects.[18.52]

Pedagogy theory - pedagogy general theory studies the issues, laws and principles of, and classification issues .[18.40]

Pedagogy history - pedagogical of thoughts progressive to be able to, school and studies the periodic characteristics, specific aspects, and significance of types of education. [18.40]

Pedagogical skills - tactics for effective training of teachers for pedagogical activities, development of pedagogical abilities, pedagogical culture and the technique content to give and speech technique studies ways to acquire. [18.40]

Correction (special) pedagogy - physical or mental developmental disability was students upbringing and teaching with related studies problems .[18.38]

Methodology - private teaching subjects content, laws, examines the organizational conditions. [18.45]

Pedagogical technology - education and upbringing in the process modern application of pedagogical technologies, technological studies the problems of increasing the efficiency of the educational and upbringing process based on the approach. [18.41]

Education management - education institutions activity It studies the issues of organization, management, control, and setting goals. [18.49]

Social pedagogy - the socialization of the individual, pedagogical diagnostics, correction and rehabilitation of deviations from social norms, and socio-pedagogical activity organization to grow issues studies . [18.70]

Family pedagogy - family education, raising students in the family with high spiritual and moral values adjectives based on to educate, parents' studies issues of improving pedagogical culture. [18.78]

Folk pedagogy - pedagogy preserved in folk oral literature, customs, rituals, national and school games, toys, etc. information and national to education circle experiments is a set. [18.98]

Comparative pedagogy - the study of the theory and practice of pedagogy in different countries, regions, and the world as a whole, in different historical periods, in a comparative aspect. status, development trends and a branch of pedagogical science that studies the laws of learning . [18.101]

Pedagogical innovation - the emergence and development of pedagogical innovations who studies the laws , also pedagogical with tradition prospective education projects science that ensures relevance. [18.49]

Pedagogical axiology- education recipient and education value that It is a field of pedagogical knowledge that serves to study educational values and determine an axiological approach to education. [18.39]

Neuropedagogy is the brain knowledge about functional differences in the activity and structure of the (right and left cerebral hemispheres) and the knowledge education in the process hand to take about field of applied science. [18.52]

Museum pedagogy - pedagogy, psychology and It is a branch of science formed as a result of the integration of museology and studies the ways of providing education in a museum environment . An employee in a museum who is engaged in this educational direction is called a museum pedagogue. [18.58]

Pedagogical anthropology - philosophical, social, psychological a branch of science that studies the creation of comfortable and individual conditions for learners based on the laws of anthropology and the anthropological model and technology of education. [18.29]

Pedagogical acmeology - in connection with the psychology of all age periods intense developing person's mature development peak - «acme person» to the level to deliver laws, technique and researches technology. [18.71]

Methodology of pedagogy. The development of the discipline of pedagogy is ensured by the idea, content, and results of research conducted to study specific pedagogical problems. Social and working release process sharp development person requires the identification of factors and pedagogical conditions that allow for comprehensive development, the elimination of situations that harm the spirituality of society and the individual. Understanding the essence of educational processes creates the need to organize scientific research to study them in a wide or narrow scope, to study the causes of their occurrence using existing indicators, and to

determine the necessary measures. The effective conduct of pedagogical research depends on a number of objective and subjective factors. In this process, it is also important to be able to choose methods that are appropriate, acceptable, and at the same time effective . [18.69]

Pedagogical research methods are the principles of educating a person, providing him with deep, thorough scientific knowledge in certain areas, the true essence of the pedagogical process, which determines its objective and subjective factors, communication and laws special check and to know methods. [18.92]

Currently, research and scientific work in the pedagogical direction is being carried out in the Republic of Uzbekistan. research dialectical to the approach is based. This approach aims to identify pedagogical phenomena, reality and their laws, the general relationship of pedagogical theoretical and practical phenomena and processes, their consistent, continuous development, the age of the student's personality, his physiological development, his spiritual, intellectual in terms of improving to go to provide, recognizes the place and role of contradictions in ensuring the development of the individual, as well as the importance of dialectical categories.

Pedagogical implementation scientific research hypotheses: complicated, certain It is a process that requires time, has research characteristics such as consistency, continuity, systematicity, and a clear goal, and for it to be effective, it is necessary to comply with a number of specific conditions. They are as follows:

- of the problem relevance and of the subject realistic determined;
- scientific of hypotheses clear and correct shaped;
- research tasks i relevance of the topic and purpose based on right determined;
- scientific research methods to the system Relative consistency and objectivity approach;
- of respondents involved in the pilot testing process age, psychological and personal features, as well as the correct consideration and proportionality of the laws of personal development
- research predicting the results in advance, to work and to put its results into practice ;
- research Effective assurance and implementation of results .

§ 1.2. Views of Eastern scholars on the development of a person's abilities and talents

The idea of perfect human perfection is the cherished dream of our people and an integral part of the national spirituality. The idea of perfect human perfection has found its profound expression in the sacred book of Zoroastrianism, the Holy Quran and hadiths, and in the works of Eastern thinkers.

During the Renaissance, Eastern thinkers in their works on education and upbringing, the problem of forming a harmonious personality, the ideas of creating conditions for a person to achieve happiness on earth, are noteworthy. In the book on the history of pedagogy, al-Farabi's concept of virtuous human qualities, ways and methods of acquiring knowledge, al-Biruni's views on methods of acquiring professional knowledge, Ibn Sina's teachings on achieving mental, spiritual and physical perfection, al-Khwarizmi's scientific knowledge, and his works on ways to solve life problems occupy a special place.[80.78-84.]

In particular, al-Khwarizmi notes the high place of science in the formation of personal qualities and the development of interpersonal relationships. He attached great importance to observing the individual, conducting experiments, developing skills and abilities, and other means of developing mental qualities. He expressed his thoughts on this in his works "Al-Jabr Wal-Muqabala", "Hisab al-Hind" and others.

When thinking about the uniqueness of education as a social phenomenon, it is emphasized that it is a specific goal-oriented phenomenon. When analyzing the factors affecting human development, we can see that the importance of education is of great importance.

The effectiveness of educational work is shown to depend on this. That is, first of all, every educator who is engaged in education must first clearly imagine his activity and the goal set for it, and understand the importance of this goal. Therefore, it is necessary to imagine in advance the questions of what kind of person should be educated, what kind of person should be as a result of education. This goal must correspond to the goal of society, which is to educate a perfect person. [2.26.11]

A person always lives surrounded by people, and in the conditions of a social environment, his mental development and thinking ability are realized. In this, there must also be conditions for the normal physical development of a person.

The mental development of a person develops intensively under the influence of social communication and upbringing. Mental development is successful only if educators systematically influence their cognitive activity at the right time and place. Therefore, mental education is understood as the activity of educators aimed at developing the mental strength and thinking of students, and instilling in them a culture of intellectual labor.

Intellectual education is part of the social education system, and its content is to learn the system of knowledge across all disciplines and, on this basis, to form a scientific worldview in young people, and to develop their thinking and creative abilities.

Intellectual education is carried out by providing general information in all subjects. In this process, students are given knowledge based on educational programs, and qualities such as memory, attention, thinking, and imagination are developed in them.

In the creative heritage of Abu Nasr Al-Farabi, the classification of sciences, which was first created by him, occupies a special place. The scholar notes that in order to develop the qualities of perfection in a person, first of all, one must master scientific knowledge, and also emphasizes the importance of the abilities of perception and thinking as the basis of the mental development of a person. In his works such as "The City of Virtuous People" and "On the Path to Happiness", Al-Farabi speaks about the content, purpose, tasks, ways and means of educating a perfect person. Al-Farabi is considered the first scientist to define the concepts of "education" and "education". Al-Farabi, reflecting on the human intellect, says the following: [80.78-120]

- be able to quickly understand all issues, discussions, and arguments, grasp their meaning, and quickly discern the speaker's purpose and the truth of the idea expressed;
- May his memory be very strong, and he will be able to remember everything he has seen, tasted, or felt, without forgetting it;
- May his intellect be so quick and sharp that as soon as he senses a sign of something, he will quickly know what that sign means;

- be clear in their words, and be able to express their thoughts and ideas fluently and clearly;

- Have a love of knowledge and learning, and be able to easily absorb the knowledge you want to learn without feeling overwhelmed.

Intellectual education is the basis for the comprehensive development of a person. It increases labor productivity and develops a creative attitude to work [2.1.38].

So, when Abu Nasr Al-Farabi says that moral virtues are knowledge, wisdom and consideration, conscientiousness, humility, putting the interests of the majority above others, truthfulness, striving for spiritual elevation, and justice. The most important thing is that every person be knowledgeable and enlightened. That is why Al-Farabi considers it as morality. From this we can see that Al-Farabi also organizes morality as an expression of the behavioral effects of morality.

In his work "Khay ibn Yaqdan", Abu Ali ibn Sina tells the story of how his eyes were opened as a result of his initiation into the establishment of knowledge and enlightenment, and as a result, knowledge also manifested its beauty. He describes knowledge as a bright, radiant light that does not sleep, a youth that does not age, and a back that does not bend. He notes that he began to study what was necessary and possible for thought, and that he used his mind in this way.

Ibn Sina created methods for the interaction of mental, moral, and physical education in human development, and took his place in the field of education. In his work "The Canons of Medicine", Ibn Sina scientifically and practically substantiated the influence of hygienic education on human behavior, physical and mental health.

In his opinion, no matter how intellectually and physically mature a person is, if his knowledge and character do not correspond to the moral standards, such a person cannot be considered a true member of society and cannot benefit it. Ibn Sina considers people who strive to live for the people, for the common good, rather than for themselves, to be people of good morals.

Ibn Sina's doctrine of the results achieved through knowledge occupies a special place in the theory of reading. In his opinion, the subtle knowledge of objects is achieved by the mind based on analyzing their appearance and determining their causes. Ibn Sina developed the stages of development of the mind. The first stage of

perception by observation is the interpretation of mental categories. The second stage is the perception of two types of thoughts. The third stage of the development of the mind is achieved by the perception of acquired thoughts. Then it is called true mind. Ibn Sina understands the innate talent of a person, as well as the ability to think that is formed on the basis of experience and in the process of knowledge. He defines the mind as the primary innate healthy thinking of a person, the faculty that creates good and bad deeds, distinguishes them. The mind is manifested in human actions. He believes that a person analyzes objects and phenomena with the help of reason, generalizes them, and chooses the best of them. He also divides the mind into two categories. One of them is theoretical intelligence, which is the ability to perceive the essence of the general things in existence, and the other is practical intelligence, which is the ability that appears as a motive in the selection of objects. [2.26.47]

In his work "Kutadgu Bilig", Yusuf Khos Hajib describes knowledge as great and education as great, because an intelligent person becomes great, he adds educated people to the original category of people, and says that all noble deeds can be accomplished thanks to knowledge. Even in those times, the scientist predicted that "knowledge even paves the way to heaven." He believes that since man appeared in this world, only educated people have done noble deeds and conducted just policies. Even rulers, if they govern the country and state with intelligence, knowledge, and intelligence, the country will be prosperous and live a peaceful life. He says that in the world, a person can achieve his dreams and greatness thanks to knowledge and intelligence.

But such knowledge and intelligence are only appreciated by those who are wise and intelligent like themselves. He says that the ignorant and ignorant cannot afford such qualities, because he is saddened by the fact that all the mistakes in society are due to ignorance, stupidity, and ignorance.

The scientist likens knowledge to a jewel that has no equal, saying that it elevates a person and helps them discover the secrets of the world.

He emphasizes that whatever a person achieves, he achieves it because of knowledge. But he describes knowledge and intelligence as a sacred friend and a loving relative, saying that no one can steal this wealth.[2.26.54]

Works such as Kaykovus' "Qobusnama", Ahmad Yugnaki's "Hibat ul-khaqoyiq", and Jami's "Bahoristan" contain reflections on the content, methods, and educational tools of forming a well-rounded personality.

One of our great scholars, Abu Raykhan Beruni, also thought about abilities. Beruni emphasized that a child's knowledge progresses from simple to complex. This begins from early childhood. This thinker defines unique abilities by the characteristics of the brain and nervous system. But this does not mean that people with such characteristics will become famous. Everything is decided by subsequent education and upbringing. As a result of good quality education and upbringing, in some cases, gifted children grow up and become talented people in one or another field.

Al-Beruni, who was known for his teaching and upbringing, wrote in his works that the unique abilities that shine from childhood can fade with age.

Not only Beruni, but also the science of that time came to the above conclusion regarding the theory of innate abilities. However, in order for capable and talented people to realize these qualities, they must be provided with the necessary conditions and work hard, otherwise their abilities may fade away.[2.30.44]

The great son of the Uzbek people, the enlightener Alisher Navoi, believed that a person is formed in relationships with people, especially as a result of their spiritual and moral influence on each other. He understood relationships between people in general in terms of living as a single society, having the same opinion, and relying on human ideals.

Navoi considered perfect people of his time to be "people of meaning." "People of meaning" are people with thinking. Thinking is understanding the truth. By "people of meaning" we should understand people who are intelligent and wise, humble and noble, capable, truthful and selfless. People who possess such qualities have broad thinking.

According to Alisher Navoi, people with a sense of meaning, that is, meaningful people, are mature individuals. In his opinion, bringing the younger generation to maturity means raising them to be educated, endowed with the best qualities. Education plays a leading role in this, and Navoi says that just as there are children who are capable learners and who are susceptible to the influence of

education, there are also children with bad behavior, who can be corrected. He repeatedly emphasizes the importance of education in the development of a child's personality.

Man strives for perfection with beautiful qualities, good qualities, and hopes and intentions as pure as light. Having tasted all the joys and sorrows of life, pleasures and pains, labor and hardships, and drawing lessons from them, he attains the ability to live and create. Man has drawn conclusions from all the experiences and lessons he has experienced over thousands of years and has embarked on a bright path.

A person who strives for perfection will never reach the end of this striving. Therefore, a person who says, "I am perfect, I have achieved perfection," is mistaken. A person makes mistakes and shortcomings in his life, but a person who understands these mistakes and shortcomings, corrects them, and tries not to repeat them is a perfect person. There is no limit to human perfection. Continuous striving for perfection is the essence of progress.

Man is considered the greatest of all beings in the universe. The mind is amazed at his perfection, because man thinks deeply about the truth. To embark on the path of perfection, he gradually searches for his own identity, gets to know the world. When Alisher Navoi called for "Become perfect, my profession," he included many characteristics necessary for perfection. If a person does not cleanse himself of such inclinations as greed, lust, heedlessness, and ignorance, he will never be perfect. Living in the "House of the World" is becoming its citizen. Alisher Navoi wanted man to rise to the status of a child of the world. He considered this very status to be the highest peak of perfection. The gift of intellect bestowed upon man in this world is such a powerful force that with it a person can cultivate himself in any state he desires, overcome and solve any suffering, any evil, even the most complex problems with the gift of intellect. Spiritual perfection creates a lofty abode of goodness in the human heart.

The development of intelligence is achieved through reading, learning, analysis, perception, belief, and life experience. Just as the transformation of a young sapling into a mature tree depends on care, so too, in order for a human child to grow into a complete person, it is necessary to pay attention to upbringing from infancy.

The tasks of upbringing are broad and multifaceted. If the main task of education is to equip students with knowledge, skills, and competencies, then upbringing is to educate young people in a way that will benefit our society, themselves, and their families, and to develop and shape their talents to the level of their abilities [2.26.92.]

Our national pedagogues, prominent representatives of Uzbek national science and enlightenment, who emerged in the second half of the 19th and early 20th centuries, such as Mahmudkhodja Behbudiy, Abdurauf Fitrat, and Abdulla Avloniy, also left their valuable legacy in the field of personal education.

A representative of Jadid literature, Fitrat expresses his views in his works on education and its goals, school-educational work, methods and means of imparting knowledge, and ways of raising an enlightened and perfect person. In his ³³work "The Leader of Salvation", he teaches that not only the family is responsible for raising children in a perfect way, but also all members of the community. [2.26.144]

The great Jadidist writer Abdullah Avloni ³⁴also emphasized the role of education in human development in his work "Turkish Rose or Morality" and said: "The Almighty created people with natural talents and abilities, who can distinguish between good and bad, benefit and harm, and white and black. However, this ability in a person can be perfected through education. If a child is well-educated, avoids bad behavior, and grows up accustomed to good behavior, he will become a happy person. If he grows up without education and with bad morals, he will become an ignorant, shameless person who does not listen to advice and does all kinds of bad things. "Educators are like doctors who, just as they treat a patient's physical illness, treat the anger in the child's body by giving him the medicine called "good behavior" instead of the medicine called "purity," and then pretend that he needs to do something great," he says.³⁵

The growth and education of a child is carried out in the process of his activity. Socially useful work, social work, play and study activities, rational use of free time, etc. are of great importance in the life of a child. The correct organization of such diverse activities of a child, taking into account his interests, and the development of his abilities are important tasks of upbringing. [2.26.151]

³⁴ Qosimov B. The Sorrow of the Homeland. T.2001. p-67.

³⁵ .Avloniy A. Turkish Gulistan or Ethics T. 2014.yb-88.

Summarizing the above considerations, it can be noted that in the East, since ancient times, the following qualities of a perfect person have been considered: a) mental perfection, sound mind, talent, intellect; b) high spiritual and moral qualities; c) physical perfection, health of body and mind; d) aesthetic perfection. In addition, when determining the criteria for a perfect person and the positive qualities associated with it, Eastern thinkers highly appreciated the existence of the desire for perfection as a factor that encourages a person to perform meritorious, good deeds, and protects him from negative actions and fantasies.

§ 1.3. Pedagogical and psychological features of the education and development of creativity of gifted students

Since science is a decisive force in the world, one of the first tasks of every state is to educate young people, provide them with education and upbringing, and raise them as worthy personnel for the future. In our country, it is no exaggeration to say that such work is constantly in the focus of the leader of our state.

Dear, Our President Sh.M. Mirziyoyev, September 30, 2024 Addressing all parents, teachers and mentors in our country, he logically continued the above thoughts and emphasized, "Our most precious and valuable treasure in the world is our children and grandchildren, who are the flower and fruit of our lives. In today's dangerous times, in order to achieve noble goals, a person needs vigilance and awareness, firm will, high knowledge and a broad outlook, and modern professions more than ever. Education and upbringing are the sacred work of the entire society! It is a matter of life and death that always requires solidarity, activity and dedication from all of us."³⁶

Based on these tasks, today's increasing demands require the continuous psychological development of schoolchildren, and as a result of the continuous movement of this development chain, human maturity is achieved.²¹ Attention to the content of education, interest in acquiring new knowledge is the result of the schoolchild's own mental labor, and is inextricably linked with his emotional maturity.

Enrichment of the content of education is achieved by introducing new subjects into the curriculum. Teaching methods and styles are characterized by versatility, processivity,

³⁶ Mirziyoyev Sh. Address to all parents, teachers and mentors Xalq Sozi newspaper September 30, 2024

variability and resolution of contradictions (contradictions). Methods based on new didactic principles contribute to the emergence of forms of mental activity that are not the result of a direct reflection of the content of education, but arise on the basis of synthesis, generalization of pedagogical influences, that is, as a result of the internal work of psychology. Such a synthesis in the field of thinking leads not only to the mastery of methods of mental activity, but also to the real development of thinking. The didactic basis of this education is conditioned by the creative activity carried out by schoolchildren themselves. Schoolchildren not only solve problems, but also discuss the content of the task and ways to solve it, as well as observe, compare, group, draw conclusions and clarify patterns.

Today, in our country, along with all other areas, major reforms are being carried out in the higher education system to develop science and, ultimately, to bring our country among the most developed countries in the world. The next Address of the President also mentioned the changes in the sector and identified a number of tasks that are relevant for the future development of the higher education system. It is difficult to imagine the development of the country without the initiative of young people. Therefore, special attention is paid to supporting them. A person, throughout his life, forms himself, that is, his personality, changes his circumstances, and constantly develops in new ways. So, human being both its potential and its systematic development stages. When we consider the individual's state of mind in such changes in a modern way, we always feel the need for education and upbringing. Especially important is the role of constantly enriching one's talents with new knowledge when acquiring knowledge and choosing a profession. This process is a common basis for activity. Existing human activity at each stage of the development of society, expressed through the principles of yesterday, today and tomorrow, in a word, differs in various manifestations, in various forms of practical activity during its historical period.

Our country has set itself very ambitious goals and tasks. Building a new Uzbekistan, creating the foundation of the Third Renaissance is a well-thought-out, long-term, logically complementary and interconnected strategic goal and task. This is a huge process, of course. This requires educated and capable personnel. Therefore, the head of our state has set the task of consistently and radically reforming all areas of education and its comprehensive development on the agenda. The development of

education and human capital has been identified as the fourth priority area of the Development Strategy of our country.

It is known that mastering generalized methods of solving various problems is an important way to increase the efficiency of effective thinking. Because the leading role in thinking depends on the development of generalization, that is, the establishment of relationships, connections between the elements of the problem and the transfer of these relationships to similar situations. Generalization is an invariant characteristic that applies to all areas of activity, including education.

It is known that internal and external relations, the connections between them, are constant and general, and we consider them as the product of a practical system of activity and evaluate them as the main factors. Therefore, humanity, while thinking, uses its ideas, thoughts and views in its practical activities, and continuously develops and improves them.

There is no such thing as a student without abilities. It is only necessary to know his interests and aspirations, to direct them correctly, to discover and encourage his talents. In the process of carrying out activities, it is necessary to meaningfully organize students' free time, to promote them practically, and to instill in young people such high qualities as patriotism, kindness, and humanity. The role of "Barkamol Avlod" schools in the preschool and school education system in arousing interest in schoolchildren in the profession, instilling certain skills and qualifications, in correctly directing their abilities, and in meaningfully spending their free time is incomparable. It is not for nothing that our esteemed President emphasized the need to develop free and creative thinking, teamwork, and communication skills in students. Our current sons and daughters are the fruit of the future.

On this basis, in practical activities skill life difference in person, in group self-esteem understanding the external world around us, to know The process will be smooth. you are welcome Knowledge is acquired step by step. are obtained, skills and abilities are acquired, and as a result, human activity is systematically developed. Scientific research is a mature person the influence of heredity, race, nature, upbringing, or practical activity on the development of He knows that he is a man. "Together" with daily relationship he is a slut resident, self understand, every one movement m u f i c t i o n person x o s be best important and

he is my brain specialty – this he /she / it active . [80.113 .]

Activity is a unique active attitude of a schoolchild towards the outside world and the environment. The specific nature, essence and importance of the education and development and management of gifted students' creativity is that it is reflected in the life of the individual , as well as an important form as it is what happened - to the event the relationship and active affects participation .

While studying the status, essence and importance of the development and management of gifted students' education and creativity , the scientific literature has focused on the topic of "Creative activity , - deb emphasized , AMMatyushkin³⁷ cognitive processes with b is heavy is the system that is " - he emphasizes.

Yakovleva : "Creative activity is a human activity body movements "it is a process or a complex," he admits. They think: "The bullet is the one who oh my god various activities formed in the process ",-saying calculate . [67.39 .]

The scientist A. N. Leontief , in his scientific hypotheses , personal activity main pedagogical and psychological essence theories , i.e. education activity l approach it in the ideas and principles investigates the implementation of

❖ If the practical activity is the object of one part , the second part is the result of the effect of morals on the brain . arrival ;

❖ Passion for activity influencing activity what is it t h e t h e - this this is a thing maybe it 's a matter of time sustainable increases ;

❖ In material existence subject activity directional - systemic social m u n o sabatl a r d at ar kib top pad ;

❖ A gifted student active i yati to the psyche, its society history to nature related , this current life itself is enhanced and polished

❖ Creative student in the activity spirit , creativity , inner activity in the adjective manifests itself in the process ³⁸.

³⁸ A. N. Leo n tev "Deyatelnost. Soznanie. Lichnost" - 1975.

Summarizing all the analyses , the following conclusion can be made: the state and essence of developing and managing the creativity of gifted students is a significant activity , in which – **h i s** mind and think about any situation with thought another black , student identity n ing comes from needs I'm sorry , but who has apply knowledge to, mastery, to change , as well as to improve considered active It results in the form of .

6
In the process of learning activity , the development of the human being atrof - in relation to the world , social environment the inner part of the relationship The shape is antiradi . In this case, the person active purpose it is correct done increase that's it him/ her right organization to grow and Proper guidance is needed .

The educational process in teaching from schoolchildren many inches social work, to know the correct form of activity enough It happens when he doesn't die , in life They are slow to act . This situation eventually produces "zombies" who are lazy, unable to express their opinions, and who only do what they are told. But in most cases , when it comes to the educational process , which is a person 's opportunity to develop , it is not good for municipal authorities to interfere in it. This is completely wrong. In our opinion, if we are to truly reform education, it would be appropriate for it to be subject to three things :

- 1. Under the jurisdiction of the Ministry of Preschool and School Education ;**
- 2. Teachers and education professionals must be subject to a community** (pedagogical association). This community (association) must be completely independent of the state. If necessary, there should be a special structure that licenses teachers and allows them to engage in education, and it should operate independently of the state.
- 3. Activity consumer** , The main applicant is the parents' society. That is, the community of stakeholders... This council must be a community of sincere, knowledgeable, experienced grandparents, parents. They can gather at the level of their own or neighboring schools and control these educational institutions. Schools should be under the control of these 3 forces (Figure 1.2.2).

Figure 1.4 . Structure of the community of stakeholders for the education and

development of creativity of gifted schoolchildren.

In this educational system, municipal authorities only provide services. They should not be allowed to put "bowties" on the heads of school girls and give them flowers in their hands at various events, or to participate in political and other events outside the scope of their duties as teachers. No, local authorities have absolutely no right to interfere in this and should not be given authority.

Our Honorable President met with educators on December 29 , 2022 and talked ³⁹with them . At this meeting, Shavkat Mirziyoyev said that he wanted to close "rayono", "oblono" and "gorono". Should these departments and administrations be closed, and why are they needed? He asked the question and gave the answer himself.

If you notice, what surprised me here is not the liberation from the pressure of municipal bodies, but the relaxation of the Ministry of Education itself. The ministry had local representatives, that is, in the old days they were called "rayono", "gorono", "oblono", through whom it could exert influence on schools. The existence of these departments and administrations can be viewed from two points of view: negative and positive. From a critical point of view, instead of expelling people who could not teach at school and did not have the talent to teach, they would send them to such places. That's what we used to hear. On the other hand, that is, on the positive side, the "rayono", "oblono" should have collected various effective methods and methodologies developed by teachers in the world, the country, and the district, systematized and applied them, introduced them to schools, monitored how they worked, and performed similar tasks. That is, how these work depends on how the Ministry of Education organizes its work. Perhaps, 3-4 people work in these organizations at the regional and district levels, this needs to be looked into. What does it mean to completely close them? If there really is an organization that provides methodological services to surrounding schools or an organ that can assist with extracurricular activities, why close them?

When considering opening or closing these or those bodies, "if we close this or that, will education gain or lose? If it loses, what will it lose, if it wins, what will it gain?" - these are the questions that a decision will be made after clear, expert

³⁹ People's Word newspaper December 29, 2022.

answers are given. Why is there so much talk about district or regional administrative bodies, but there is no mention of municipal authorities directly negatively affecting the educational process. We think that this should also be paid attention to.⁴⁰

Education is an organizational process that is formed on the basis of mutual cooperation between the activities of the teacher and the student. At its core is the interaction of teaching and learning activities. The essence of the educational process can be understood through a purposeful and comprehensive analysis of teaching and learning activities. In this context, when analyzing the status, essence and significance of developing and managing the creativity of gifted students, the importance of organizing the creative activities of students in education and their proper organization in management, paying special attention to continuity, consistency and scientificity in the stages of implementing activities, and making broad use of opportunities are of great importance.

Schoolchildren, especially gifted students, the main activity of the educational didactic games for indicators, reading, mental activity, practical who contributed in case, it's what is it approximate direction of work to know, social, sports, artistic, technical, craft, inventive, small research and emotional. It is important to be active.

So, the types of activities can be divided into two: namely, active and We will separate passively. Only practical active activity all of the person opportunities to the wrong person helps to release. This activity is the end of self-satisfaction h axis as a person person power - stabilizes the voltage.

Activity in the lesson social experience I learned faster, to understand, develop communication and effective communication skills, surround himself a t r o f - the world Systematic attitude to develop, to be active in life encourages. Cognitive activity and student intellectual capacity development It provides. An important factor in the spiritual and moral formation of an active person in life is his willingness to work hard, develop always have the opportunity Actively encourage competition and h e l p s students to go through difficult processes more easily. The school various young people their activity too It

⁴⁰ December 29, 2022. People's word newspaper

changes . That's why because of this i n the meantime student individual and age characteristics Hi there . oh my god for the purpose It is perfect .

5 This process is one of the main conditions for the success of human abilities and talents, which is also manifested in human activity. No matter how skilled the teacher is, if the student himself is not active, he will not be able to achieve success.

Therefore, the student develops spiritually and morally by engaging in life issues that are important to him and that he finds attractive .

In a word, a person active league he /she / it in the event of a vehicle it's not, but its actual result there is also .

When is it time to educate ? for the purpose will achieve when she is to oneself yes other way around I am happy . come here if , social activist , When a creative , creative person is thinking .

In this case, the person activity , it's all fir potential opportunities It is a dream . To the activity scientists of the subject object interaction with in the process task character dream looks like.

To the activity him/ her contented person need reason it will be and in the system of movements done increases. Human soul the situation ma vj u dli will re-cash itself. This situation is a basic activity condition hi so bla n adi thank you in its development yes to the letter bringer It is considered strong .

Current activity ordinary and high clinic difference dice High form is instinctive (inst ink) from getting married consists of. The second, high s a k l from the first growing out , it's view change name, person's conscious to move It's a circle .

Human when he turns himself into an active subject, and the natural phenomena with which he enters into a relationship, into the objects of his activity. Any activity in practice is a structure consisting of goals, realities, methods, results and processes. The conscious manifestation of the activity performed is its main feature. It occurs in consciousness through physical movements, on the one hand, and mental movements, on the other. 6 Thus, labor contributes to the emergence of practical and theoretical forms of human activity reason It's a country.

In particular, other types of human thinking and practical activity (educational play, reading, etc.) are also genetically determined. It depends on what you are doing

Systematization of activity - on the basis of labor - in the process of historical development gave rise to intellectual labor, which was manifested as a necessary theoretical activity. Systematization of activity below a s s i y elements a niqlab b ye rad i (Figure 1.2.3) :

- to activity main s a b a b l a r ;
- for the purpose of expected from the direction results ;
- movement is helpful done Various means of transportation .

Figure 1.5 . Elements of the structure of systematization of activities .

In accordance with the proposed elements, the process of the subject's continuous interaction with the being is motivated in a certain way as a whole. In its structure, the components of goal-directed action and activity, the automated manifestation of this action are clearly distinguished . comes out.

mental - psychological processes yes , yes sh ax characteristics in the formation leader Ah , what a career! et ad i .

Human social in life my life of the business important shape he /she / it a t r o f -to the world active The relationship is a joke . To the activity person various needs come into play . This needs of him in mind to him/ her relevant objects , it 's needs sugar cane It 's about the number of people who have come is expressed as an interpretation.

The nature of motivations largely depends on the effort in its implementation, as well as on the intended result in achieving the goal. The motive and purpose of the activity are also determined by the social conditions of a person's life and the level of his individual development.

The assimilation of social experience by an individual or person is important in the individual development of activity . It 's a role - playing game . Activity bar how many mutual i chki b o g'l a ng a n movements back in practice It is very loud . But yes x l dog without each one activity conscious character to the ground has It will die . O n g l i goal in the adjective in this of the movement method and character by designating give me your name . He wants result swelling of the earth on the way found what happened fence defeat encourages you to move.

So, the basis of a person's activity is t u ri , As noted above , it's the body and mental labor Physical activity , society and others through human labor one person life it is necessary material Wealth is the criterion that leads to creation .

Understanding existence through rational logic to study, scientific theories to create , literature , b a diiy and other spiritual wealth , creative scientific research, intangible wealth are based on the orientation towards creation . One of such dynamic aspects is learning. Human activity is improved through physical and mental labor, the necessary conditions for its development are created, based on life experience. Therefore, a person perceives the world around him , knowledge will master , qualification and skills h axis he/she/ it will .

With the help of the aforementioned reasons, the activity itself develops

intensively. Scientists A. Leontiev, S. R.⁴³ B. Heat and⁴⁴ and another one. It is known from research that as any activity and practical processes develop, a person's mental, emotional, and volitional qualities, abilities, character, and worldview are formed and constantly improved.

It's okay, in this biology and social the direction is constant. Its biological development occurs during infancy, schooling, adolescence, youth, and old age, and is characterized by its natural characteristics.

These biological characteristics basically it's social media adjective and from the characteristics, speech, gait, material from blessings use fitness equipment, x ul q -atvor m ye 'yorl a r in ing t a r k i b The development is intended. L.S. Vygotsky⁴⁵ education process with It depends on the relationship. But education and education student development with yes, oh my h solution when one - one with T-shirt and parallel wind in case seller It wouldn't be. They by the way each other I am not tall. in case dynamically it happens it will be, b u n i one kind can be described not". [129.171]

In the systematic development of schoolchildren, high spiritual qualities appear in two stages (Figure 1.2.4) :

The first is collective, social, group activity;

The second one is, individual, individual student's i n t e r n a l and external independence thinking method as;

Figure 1.6. Trajectory of mental characteristics in the development of schoolchildren.

⁵⁴ Bandura A. Theory of social science. SPb . — Eurasia , 2000.

Talent is a specific form of ability that ensures successful performance. The mutual compatibility of activity and ability serves to compensate for the shortcomings of other abilities.

- general abilities ensure the development of the individual's potential and specific aspects of his activity;

- A student's abilities reflect his or her aptitude, natural strengths, and character;

- One of the working conditions that shows success in an activity is talent. A gifted child is one who is clearly manifested in one or another activity. Sometimes children who are distinguished by their continuous success are an example . [2.25.5]

recognize that the development of talent is the result of a complex interaction between heredity (heredity) and the social environment (play, study, work processes) . However, the role of psychological mechanisms and self-education of the individual, along with work, which underlies the formation of this individual talent, cannot be denied.

The unique characteristics of gifted children enrich our lives and are beneficial to society.

The first characteristic is that gifted people are sensitive to everything and have a strongly developed sense of justice; they are capable of innovating and changing social relationships.

The second characteristic is that they are knowledgeable, active, and have a high level of intellectual development, which allows them to acquire new information about the environment. Creative abilities allow them to create new concepts and approaches.

The interaction of intuitive and discursive (creative) thinking in gifted children makes the process of acquiring new knowledge more effective.

The third characteristic is that many gifted children have creative abilities and high energy, goal-orientedness, and determination in acquiring important knowledge, which allow them to implement interesting and important projects in public life. [2.12.71]

Conditions for developing the creativity of gifted schoolchildren , and its implementation The process consists of the following : :

1. Education and development of creativity of gifted and talented schoolchildren : students' ability to necessary BKM's .

29

2. Education and development of creativity of gifted schoolchildren and theoretical and practical activities communication .

3. On the education and development of creativity of gifted schoolchildren busy horses heuristic property situations It is a tool that increases the possibility of creation .

4. Modern technological requirements in the education and development of creativity of gifted schoolchildren .

How can the conditions be implemented ?

The development and management of the education and creativity of gifted students in specialized schools requires special attention, as well as their ability to do so. In this regard , the following is required for the BKM : requirements It is appropriate to put it .

1. Textbook and program based on DTS materials where the one who made it himself ;

2. Based on the program and textbook, the topic is about them as os i y level of mastery of concepts and rules ;

3. Recommended topic Ability to independently complete assignments , practical activity ;

4. I am studying . on topics main problems , other ideas to listen receive and understand and express opinions;

5. Study tasks Ability to use and present didactic tools, teaching materials and equipment, information technology in the implementation;

6. Ability demonstration and that r i v o j l a ntira such as oli sh i ;

7. The student approaches the topic objective through understanding and comprehension;

8. Independent planning of the topic and evaluate the results ;

9. Recommended topics are : to substantiate one 's opinion in learning ;

10. Within the framework of the assignment and topic, the student should be able to express his/her conclusions,

9

independent opinions , etc.

It is precisely such requirements that help teachers to develop and manage the education and creativity of gifted schoolchildren , their interests , the power of learning and knowledge , individual to know the years creates opportunity and this Help determine the structure of the learning process in this regard . This is my country .

Above is requirements gifted children in the i s it true ? The priority of systematic , purposeful organization directions b air a b olina d i.

Pedagogical education a s s i y O n e of the tasks : all students ' creativity activity every side view I am a woman . provided conditions from creation i is considered borate. In specialized schools it is clear The students ' deep understanding of the problem interesting things , int ili sh i and ability show or The students who helped him to clarify , he is behind from this next ri v o j l a n i shi for him / her I t i s a b o u t giving opportunities .

On the education and development of creativity of gifted schoolchildren sh a r t -sharoitl a r ya ra t work important thing is to earn money will reach.

This b o rad a :

1. Targeted use of technologies for systematic training in innovative activities for the education and development of creativity of gifted schoolchildren .

Factors for creating friendly cooperation between teachers and students .

3. Developing the creativity of gifted schoolchildren and using innovative methods of acquiring knowledge, skills, and competencies .

4. Implementing the latest modern technologies in the education and development of creativity of gifted schoolchildren .

Data analysis helps to obtain scientific evidence in system management, the essence of the pedagogical process, as well as a systematic study of the state of collective and individual student actions in specific situations. This evidence forms the basis of practical activity. The available evidence allows you to diagnose the course of the pedagogical process and ensure the expected result.

This is important . It is the basis of the national education system composition parts sh ax, state and society , continuous education , science , production and organic It is a whole of personal and professional development

system create in view The issue of developing youth talent is like this sheep work education goals , content , styles , it 's d e k v o s i t a l a r a solution to a problem The main criterion is the performance .

The envisaged phased approaches will contribute to the development of the education and creativity of teachers and gifted schoolchildren in the educational process , as well as to the change in teacher attitudes , as well as to the continuous increase in the creative activity of students , the strengthening of their independence , and the improvement of the educational process . clean etad i . B u n d a arrow u v 5
chi education himself as an object and at the same time an active participant in the process what is it of reaching it's a joke also to be to the square It came out.

The problem in scientific research like this The sheep's work , education 25
goals , content , management methods , practical technology , conditions and formation a solution to a problem swordsman i s a criterion .

Especially in the stage of developing the creativity of teachers and gifted schoolchildren , their relationship changes , and what they It ensures the strengthening of activity and personal independence , and the improvement of educational management . In this , the creative student appears as an object of education and upbringing, and at the same time as a subject of self - discovery .

Such a targeted approach directs school education, the development of the upbringing and creativity of gifted schoolchildren , and the gradual development of the moral values of education, giving creative freedom to their inner world - to their undiscovered abilities and possibilities.

The purpose of specialized school education and its internal strength and capabilities wake up , person free creative development from these three correct , accurate , accurate benefit from cables I'm going to go .

Above is Based on ideas , we identify the creative potential of the individual and the effective factors that develop it . as follows recommendation meat possible : The stages of developing the ability, creativity and imagination of gifted

schoolchildren , and the development of an independent circle of thought are described in the following factors.

Figure 1.7. Development of creativity of gifted schoolchildren effective factors

Based on observations, education w h a t is the process ? student person creative The development of competences requires not only the selection and improvement of the educational content formulated for them , expressed in programs , but also in regulatory documents . It's time . Because , current in the era program and d a r s li kl a roq u vchini ng creative ability and potential to develop full response to demand H e w o u l d n't give it.

It is known that creative students with creative abilities are more likely to be successful in the social and humanities , exact sciences, natural sciences , didactic educational tools , and language learning opportunities . impact I am , in the school It helps to properly develop creative activity .

Usually, a person who is endowed with individual characteristics is limited to focusing on only one, the most basic characteristic, which does not allow achieving the intended goal. Therefore, in this case, it is necessary to consider the activities of the adolescent in all areas as a whole, focusing on increasing the weight of the required characteristics. Having analyzed the abilities of adolescents to solve the task set above, we found that talented adolescents have the following qualities:

- intelligence in solving problems;
- high level of logical thinking;
- easy acquisition of knowledge and skills;
- express their thoughts fluently;
- be able to distribute attention more widely;
- present responsibility;
- be able to analytically assess the problem;
- resourcefulness;
- fluency of speech;
- curiosity;
- to complete the work;
- adaptability of thinking, etc.

In conclusion, the main task in education is to analyze the educational process with new approaches . The development and enhancement of the education and creativity of gifted schoolchildren is fully based on the experience of their educational, independent practical, and professional social activities in various subjects through the purposeful development of their personal qualities and abilities.

Conclusion on the first chapter

It is known that a person's creative potential is developed through tireless and continuous work. result s i in the capacity of In this process of teaching, learning and education, creative educational content (including: methods, techniques, technologies such as learning-cognitive, organizational, motivational, pedagogical and psychological, as well as cooperation) is directed towards the child's personality.

The main goal of modern educational technologies aimed at developing the creativity and creative abilities and potential of gifted schoolchildren is to develop creative activity.

Goal-orientation sets the following specific tasks: it is assessed by the creative student's awareness of the specific goal he has set for himself, his positive motivation in his creative activity and the need for creativity, and his possession of a modern knowledge system.

According to the content of education, the development of creative potential includes practical and creative components of knowledge. Creative components

systematically develop the upbringing and creativity of gifted schoolchildren. They improve the technological processes of practical activity, direct the student to small research, help him improve on the basis of methods such as inquisitiveness, creativity and openness to constant critical analysis.

How does this process bring positive results to the student's personality, education? Of course, it is important that the implementation of these works is both organizational and motivational. In this case, traditional and non-traditional forms are used, such as classes held under the open sky, in the embrace of nature, excursions to museums and various exhibitions, the use of targeted video presentations, literary meetings, themed evenings, individual creative projects, circles, clubs, practical classes, conversations on various topics, creative exhibitions prepared by students based on their own capabilities and interests, and competitions.

Therefore, child-centered principles in educational regulatory documents enrich the content of active, practical work and provide its specific tools in real, life situations. needs the practical aspects .

CHAPTER II . PEDAGOGICAL CONDITIONS OF THE MANAGEMENT TECHNOLOGY OF CREATIVE DEVELOPMENT OF GIFTED CHILDREN IN UZBEKISTAN

§ 2.1. National Education Initiative in the management mechanism for the education and development of creativity of gifted children in specialized schools

At the current stage of the development of the education system, serious attention is being paid to the development of organizational and management structures of education in countries around the world, including the USA, Japan, the People's Republic of China, Singapore, South Korea and other economically developed countries of Europe. It is known that in the economies of such developed countries, on average, 16 percent of the national wealth of countries falls on material capital, 20 percent on natural resources, while human capital accounts for 64 percent of this indicator, in some countries, and 80 percent in Germany and Japan ⁵⁵. Such statistical data indicate that human capital is becoming increasingly important in modern societies. Human capital shows that modern management and adherence to its principles are being given great importance in the processes of development and management of the education system.

the head of our country, Sh.M. Mirziyoyev, ⁵⁶noted, "In developed countries, great attention is paid to investing in the full cycle of education, that is, investing in the education of a student from the age of 3 to 22. Because this investment brings 15-17 times the benefit to society. In our country, this figure is only 4 times." This issue is our most painful point.

In order to implement these tasks, a number of decisions are being made in the country regarding modern teaching in the continuing education system, improving cooperation, increasing the efficiency and responsibility of education management bodies, and ensuring the quality of national education through the effective

⁵⁵ The Knowledge Based Economy. Organization For Economic Cooperation and Development, Paris. 1996. - P. 9-10.

⁵⁶ Uzbekistan Republic President's decree of February 7 , 2017 " In 2017-2021 Uzbekistan Republic further development according to Actions " strategy " about PF -4947- No. Decree . Collection of Legislative Acts of the Republic of Uzbekistan. 2017. No. 6. Article 70

introduction of nanotechnologies, advanced pedagogy, and ICT into the educational process.

Improving the quality of national education and its resulting effectiveness is one of the main research tasks, which serves to gradually develop scientific and pedagogical opportunities for improving its activities in management technology. It involves conducting analyses of the content, expected results, philosophical and pedagogical analysis of the quality of education, development trends and stages, as well as the essence of management that ensures its effectiveness. The scientific research topic is viewed theoretically and methodologically, focusing on the problem of quality of education and management. It also requires, first of all, an analysis and synthesis of the essence of such basic concepts as “quality of education”, the result of “efficiency”, and the methodology of “quality of education management”.

Today, acquiring knowledge or education is one of the most important issues facing the growing younger generation. It is a general process aimed at continuously transmitting to future generations the life experiences of great social significance, organized by the older and middle generations, and is considered a continuous, social institution, one of the integral social substructures of society.

When thinking about the "quality of education", the education system, which must be mastered throughout life, is a systematic process with the power of continuous complex development, its components, qualitative and quantitative tasks, and is explained by the change and guarantee of the social, economic, methodological and practical-technological environment in the activities of educational institutions on the basis of the DTS. The quality of continuous education is based on the characteristics of integrity, consistency, formation of knowledge, skills and competencies of the learner and their systematic development, and is implemented through an effective educational process.

a separate socio-pedagogical, practical-psychological process aimed at the integral formation of students' basic and general competencies, as well as the periodic realization of their creative potential (Figure 2.1).

Figure 2.1. Structural trajectory of the national education system training process .

The socio-philosophical-pedagogical essence of the concept of national education quality is clarified by the stages of its development. Therefore, we believe that it is appropriate to conditionally analyze the quality of national education based on the following periods: Figure 2.2.

2.2 . Conditional analysis of national education quality by period.

1. The period from the earliest times to the Middle Ages.
2. The period from the Eastern Renaissance to the 18th century.
3. The period from the second half of the 19th century to the middle of the 20th century.
4. From the period of independence to the early years of the New Uzbekistan era (end of the 20th century - 21st century)

Although the origin of the concept of quality of education is not mentioned in the oldest sources in terms of historical periods, there are definitions that convey this essence. In particular, a number of pedagogical scientists, including N. Alimova ⁵⁷, Ye. Semchenko, S. Abdulina, N. Bagutdinova ⁵⁸ and A. Ye. ⁵⁹Yefimov, put forward in their scientific research the idea that the initial stage of the formation of this concept of “quality of education” dates back to the era of the existence of ancient world states.

From the sources that have come down to us, we can learn about the purpose, quality, methods of improving education, and expected results in the most ancient or ancient world.

the great Aristotle ⁶⁰, quality consists of a certain state, different aspects of being, properties inherent in an object, points of location of an object in development and movement. He explains that objects are not similar to each other, but have their own individual characteristics in terms of quality.

⁵⁷ Alimova N. Metod "MXAT" na prakticheskikh zanyatiyax po literature dlya navleniya" Russian language and literature" in Uzbekistan .

⁵⁸ Bagutdinova N. Upravlenie kachestvom obrazovaniya / Bagutdinova N., Novikov D. // Standard quality. 2002. - No. 9. - S. 68-73.

⁵⁹ A.E. Efimov Novaya istoriya, 1789–1870 / vkleyka: karty (scany 37-38; 71-72; 89-90; 123-124; 157-158; 166-167).

⁶⁰ Aristotle "Politics of nature. Is it a comment or a comment" 2016.

Therefore, in the socio-philosophical interpretation, the most effective result of education is determined by the person and his perfection. According to another scholar, Confucius ⁶¹, the main purpose of education is for a person to directly acquire spirituality, morality, knowledge of traditions, acquire a culture of national values, and love for the Motherland, which is reflected in his patriotic feelings .

According to the thinker Yusuf Khos Hajib, education, knowledge, and intelligence are formed and emerge as a result of countless labor and tireless effort. Like Yusuf Khos Hajib, many Eastern scholars recognize that the main way to achieve results is that "constant and consistent practice is the gardener of talent."

During the 9th-12th centuries, during the Renaissance in Central Asia, education and its qualitative stages began to acquire a specific meaning and essence. The scientist Al-Khwarizmi, who lived and worked during this period, attached great importance to the ability of the learner to use his personal observations and knowledge in practice and in life. He was one of the first to lay the foundations of the observation-testing and diagnostic method. 15

Another Eastern thinker, Abu Nasr al-Farabi, in his works reflecting socio-educational views, gave ideas about teaching, quality education, effective teaching methods and techniques, emphasizing the great importance of education in human development and the fact that as a result of it, a person develops in accordance with the requirements of society [80.123]. Abu Ali ibn Sina ⁶²presented successful educational methods and criteria for the educational process in his time. He also gave valuable ideas on taking into account such principles as "from simple to complex", "from bottom to top" that have always been important in education, and on directing the student to the next stage of education in the educational process according to his age characteristics, talents, interests and abilities, and the state of mastery. [80.143.] 6 He emphasized that by developing the ability to verbally express newly acquired knowledge and to think independently and logically, a learner can develop the ability to apply his knowledge in practice.

The views outlined above are directly related to education and its quality, and the most important theoretical ideas of that period are based on the principles of

⁶¹ Ismatullaeva N. *The interpretation of the concept of "perfect man" in the sayings of Confucius* Tekst nauchnoy stati po spetsialnosti " Yazykoznanie i literaturovedenie " -2021.

⁶² Khairullaev M. Renaissance and Eastern thinker. T., Uzbekistan -1971.

statehood, which are directed towards perfection, and its development is based on the joint and systematic results of various branches of science.

Historical sources show that in the 14th - 16th centuries, special attention was paid to education, and the theoretical views of the Renaissance were somewhat improved. By this time, education was considered a tool that serves to ensure human perfection, to take it out of any situation. It was understood that it is important for a person who has received good knowledge and morality, education and upbringing to effectively use the knowledge he has received in practical activities, in his own life. In the work of the Sultan of the Word, Alisher Navoi, "Mahbub ul qulub," a person who has received knowledge but has not used it is compared to a person who has sown seeds and has not enjoyed the harvest. Therefore, this definition indicates that the views of that time also correspond to the standards and requirements of students' education today. Indeed, knowledge, skills and qualifications are important for the student's personality and are the basis for determining the effectiveness of the quality of education.

Along with the change of eras, it is observed that by the 18th century, attitudes towards teaching, the quality of education, and the improvement of educational processes had changed somewhat. The system of views and attitudes towards this education and upbringing was updated and improved. In social life, the theoretical and scientific experimental achievements of science began to be interpreted as a means of determining quality. One of the outstanding figures in the history and theory of pedagogy, the Czech scientist Jan Amos Komensky, ⁶³ developed didactic principles of teaching in his work "Great Didactics" taking into account the natural cognitive nature of the student. Or Adolf Disterverg, focusing on the special importance of regular repetition of the knowledge of participants in the educational process, outlined the main requirements of educational didactics as 33 laws and rules of education. In order to further accelerate and develop the student's abilities, the scientist emphasizes that it is possible to teach teachers not to present the answer to the task along with it, but to teach the student to find the truth through various ways,

⁶³ Yes. A. Komensky Ya.A. Great didactics. Moscow, Moravia 1932,
Yes. A. Comensky, D. Locke, Ch., Pestalozzi Pedagogickoe nasledie. Izd. "Pedagogy" 1988.

methods and means. Also, ⁶⁴the instructional education proposed by A. Disterverg is based on the principles of moving from "near to far", "from simple to complex", "from known to unknown". ⁶⁵In his work "Human as a subject of education", the educator KDUshinsky pays special attention to teaching in the educational process and its content, principles, forms and methods. In particular, he improves and develops the issues of demonstrative, conscious and coherent teaching in order for the student to achieve results, and requires the achievement of a variety of forms and methods of teaching.

At this point, the concept of "Quality of Education" ⁶⁶is also drawn to our attention by the opinion expressed by S.Ye. Shishov and V.A. Kalney, who define it as "quality of education is the level of satisfaction of the results and goals achieved by participants in the educational process from the educational service provided by the educational institution." This opinion is very consistent with our thoughts.

In terms of the essence of the definitions of the quality of education, ⁶⁷the definition given by V.A. Chachalov is of particular importance. In his opinion, quality in education is not only the result of the educational process, but also an active system, models, organization and management of the educational process, which ensure the general personal and collective development of learners and, while meeting their needs, contribute to the development of science and technology, society. The scientist A. Voronin ⁶⁸emphasizes and interprets the quality of education as a category that determines the state and result of the educational process in society, its compliance with the needs and expectations of the development and formation of civil, life and professional competencies of the individual. Another scientist Ye. Dombrovskaya ⁶⁹recognizes the quality of education as the compliance and proportionality of education with the requirements of the State Educational Standards, educational documents of the relevant educational program. Scientists N.

Shmireva, M. Gubanova, and Z. Kresan ⁷⁰believe that the quality of education is a set of consumer characteristics of educational services that ensure the satisfaction of the needs for the comprehensive development of the student's personality .

Based on all the above definitions and descriptions of the quality of education, V. Gurov was able to divide the attitudes expressed towards this concept into four approaches. Based on their approach, we have described the quality of education in national schools as follows. (See Figure 2.3).

Figure 2.3. Definition and approaches to educational quality in teaching .

In particular, **based on definitions and approaches to teaching** , It is no coincidence that the country adopted the Concept of Development of the Public Education System until 2030 , which aims to improve the quality of education in Uzbekistan and to enter the top thirty most advanced countries in the world according to PISA criteria by 2030 .

In the course of our research, the experience of leading countries has once again proven that the development of a roadmap for creating quality education standards is an urgent task. Textbooks and study guides based on national education standards, A teaching method and an assessment system are created. The standards are aimed at developing education, as well as improving the qualifications of teachers. They also allow all the above components of the education system to be connected and implemented together to achieve the best results.

create the basis for achieving the goals set by interrelating the above-mentioned elements .

We believe that it would be more effective for the Ministry of Preschool and School Education to prepare a draft of the national standard for general secondary education by today. It would also be appropriate for the standards to be developed with the participation of local and foreign experts.

Our President Sh. M. Mirziyoyev said in his speech: “ It is clear to all of us that the cornerstone of development, the power that makes a country powerful and a

⁷⁰ Kretsan Z.V. Osobennosti predstavlenii obuchayushchikhsya vypusnykh kursov o trudnykh zhiznennykh situatsiyax v budushchey professionalnoy deyatel'nosti i o sposobah ix preodoleniya [Electronic resource] // Psihologo-pedagogicheskie issledovaniya. 2021. Volume 13. No. 1. S. 117–130. DOI: 10.17759/psyedu.2021130108

nation great, is science, education and upbringing. Our tomorrow, the bright prospects of our Motherland, first of all, are closely related to the education system and the upbringing we give to our children,” he emphasized, continuing his thought, adding that modern life today is unimaginable without the development of science and education, as if humanity revolves around the axis of science. It is not for nothing that the development of education is defined as the first task in the leading countries of the world. After all, the future prosperity of the country will be achieved precisely with the achievements achieved in this area.

Today, the educational activities of the preschool and school education system have been further improved, and the centuries-old aspiration of our people for knowledge is once again being manifested. Our youth are striving to live a healthy and beautiful life, to have a permanent job in their chosen profession, to take responsibility, to avoid humiliation of human dignity, in short, to achieve perfection, and in this process they see education as the most important condition. As the Head of our state noted, we have set ourselves the main goal of creating a new Renaissance in Uzbekistan, that is, the foundation of the third Renaissance, through large-scale democratic changes, including educational reforms .[47.182]

At the same time, Uzbekistan Significant positive changes are taking place in the education system. The appearance of educational institutions is changing, the quality of teaching is improving, the financing of textbooks, teaching aids and social support is being strengthened, including the increase in teachers' incomes . Separate state structures in the field of innovation are being created, which is leading to the opening of new departments at the next stages of education, that is, in higher educational institutions. All this will undoubtedly change the approach to the education system and the quality of education, and will serve to increase its weight and level.

Our first President I. Karimov said, “It is a great honor for us to discuss the model of education reform formed in Uzbekistan and the experience gained in its implementation with the participation of prominent scientists and specialists from all over the world, heads and representatives of world-famous educational institutions, and influential international organizations.” [51.38] It is clear from this that today, as the first joyful fruit of all our efforts in the field of education, when we see a new

generation of specialists who can speak foreign languages freely and, at the same time, express their thoughts fluently, beautifully and concisely in their native language, the heart of every parent, teacher-coach, and every well-intentioned person in our country is undoubtedly filled with feelings of pride and honor.

In fact, the education system in our Republic has been fundamentally reformed with a renewed sound pedagogical thinking, a set of theoretical, methodological, and practical pedagogical approaches designed to bring the intellectual, spiritual, and moral level of personnel trained in educational institutions to the level of developed countries, which is intended to ensure the full manifestation of the creative abilities of a spiritually and intellectually mature person in the national model of education [3.4]. The "National Model of Education", which is an absolute novelty in the experience of the world education system, consists of 5 components: the individual, the state and society, continuing education, science, and production, and has been improved through new principles.

The National Education Program of the Republic of Uzbekistan describes the "National Model of Education"⁷¹ and its components, and defines their main tasks. In particular, the individual is the main subject and object of the personnel training system, the consumer of services in the field of education and their implementer. The uniqueness of the national model of education is clearly manifested at the very beginning of the component. In it, the individual is considered not only as a consumer, that is, an object, but also as its implementer, that is, a subject of the educational process. This turns the individual from a consumer of education into an executor of this process, increases his activity and accelerates his development.

The state and society regulate and control the activities of the education system and the training of the national personnel reserve. It is designated as the implementer, responsible for the training and admission of a new generation of personnel. While implementing the national model of education, the state and society assume responsibility for organizing the training of a new generation of personnel who are in demand and competitive in the labor market, and also for the quality of trained specialists through control of the educational process.

⁷¹ National education model and practice . T . New Uzbek education yesterday and today

The main goal of the continuous education system - the training of qualified competitive personnel, includes all types of education, state educational standards, the system and structure of personnel training, as well as the environment in which it operates. The national model of education, with its transparency, emphasizes that the development of a person is a continuous process that continues throughout life. Therefore, it is envisaged that the activities of all links of the education system that should participate in the formation of a well-rounded person should be continuous and continuous. The amount, procedure and process of implementation of knowledge, skills and abilities that should be formed in a person at a certain stage of education should be implemented by this continuous education.

The essence of science is to prepare highly qualified specialists in accordance with modern requirements and use them. It also develops advanced pedagogical and information technologies. In the national model of education, this component is given special importance in the national program for training new generation personnel. Thus, science simultaneously performs the functions of a preparer, consumer, and developer and guarantees

The production system is an important and main customer that determines the need for personnel, as well as the requirements for their level and quality of training, and is a participant in the process of financially and materially providing the system for training new generation personnel. In fact, production is one of the most important parts of the industry, the national model The number of personnel required for a particular sector of the national economy is determined by the economic and technological foundations on which their training should be based .

The national model of the education system is based on the national characteristics and mechanisms inherent in our people, and it clearly takes into account the ways of forming a harmonious and mature personality and effectively implementing its intellectual, professional and spiritual potential in its activities. In the national model of education, which has such a priority, special attention is paid to the appropriateness of professional competence and spiritual qualities, the formation of which is important in a person. Based on the above considerations, the national education system, its quality, is a process dependent on the financing of educational institutions, material and technical equipment, and the perfect introduction of

modern management technologies. In these processes, the quality of the education system is important, and T. I. Shamova, T. M. Davidenko and G. N. Shibanov show that the quality of education is characterized by the interrelation of the four components corresponding to certain elements of the education system. (See Figure 2.4).

Figure 2.4. Quality of education systems.

Since the 1990s, the management technology for the development of student education and creativity has begun to reflect scientific and pedagogical opportunities for increasing the effectiveness of activities, the quality of education, the quality of intellectual resources, and the main indicator of human life.

In this regard, ⁷²the research of Sh. Kurbonov and E. Seytkhalilov also explains that the quality of education, especially the national education system, is understood and explained as "the level of satisfaction of various participants in the educational process with the results expected from the educational services provided by the educational institution " or "the effective level of achieving the goals and objectives set in education."

Olim O. Rakhimov considers the quality of education and its assessment criteria, educational standards, the quality of education and its assessment system in the foreign and Uzbek higher education systems, accreditation systems for higher educational institutions, the application of modern information and communication and innovative pedagogical technologies in ensuring the quality of education. He considers assessment through the widespread introduction of effective outcome methods.

⁷² *Kurbanov Sh ., Seytkhalilov E. Management of the educational system. - T.: "Turan-Iqbal". 2006. - p. 101.*

The national education system ⁷³determines not only the compliance or maximum level of knowledge of learners and creative students with state standards, but also the successful functioning of an educational institution, its management capabilities, as well as the results of the competent activities of each teacher and leader in ensuring the quality of educational services.

Increasing the efficiency of activities in the management technology of student education and creativity development will further activate the management capabilities of the national education system and improve the scientific and pedagogical capabilities of modern teaching.

The new Uzbek education is free from various commandments and is distinguished by its focus on the formation of the student's capabilities and talents through educational stages focused on the individual. The idea that the teacher is the absolute truth in the education system is somewhat outdated. The opinions of students and the general public who independently think about problems and their solutions are listened to. It is substantiated and found its proof in each observation based on real realities.

Summarizing the above points, we can draw the following conclusions:

National education system⁷⁴ further activates management capabilities, assesses the quality of teaching as a socio-pedagogical process, determines and controls the status and results of management;

students' creativity is a human need, in which it is considered, classified, and guaranteed as a means of satisfying the interests of society and the state;

It is important to improve the efficiency of management technology, diagnose the quality of education and the achievement of learning goals, implement, modify, analyze and put into practice advanced and modern methodologies.

If we dwell on the fact that the national educational initiative in the management mechanism for the development of creativity in specialized schools is directly related to the quality of education, as well as the concept of educational effectiveness and modern management capabilities, these concepts differ from each other, and for a gifted student, quality is primarily determined by the ratio of the

⁷³ Decree on approval of the National Program for the Development of Public Education for 2022-2026 New Uzbekistan Newspaper 2022. May 12

⁷⁴ That newspaper page.

result to the goal, while efficiency is determined by the ratio of the result to the costs and resources spent.

According to Sh. Kurbonov and E. Seytkhalilov, the manageability of the education and development of creativity of gifted students is associated with the concept of “productivity” ⁷⁵. In fact, this means a characteristic of activity that indicates the ratio between the usefulness of the results obtained over a certain period of time and the costs associated with it.

In this sense, productivity is applied to educational management. This concept, based on the above explanation, proves that the effectiveness of educational quality can be achieved through the implementation of quality management in the educational process. In the national educational process, quality education shows the results of the effectiveness of students in specialized educational institutions, is reflected in the purposeful high-performance management actions of the teacher during the teaching process. It is appropriate to provide such education in accordance with the plan of effective management actions of the teacher in the educational process, including goal setting, analysis, diagnosis, prediction, design, planning, organization, information, control, evaluation and making changes, as well as analysis of completed activities.

of the lesson , determining its quality and effectiveness, implementing strategies as the most effective means is an important factor in management. In this area of pedagogy, many studies have been conducted and are being conducted to date to solve this problem. Regarding the quality of education and its management, LVGolish, MXMakhmudov express their views in their scientific research on the creative organization of education, improvement of education, openness and democratization of education and other features. In the CIS countries, including Russian scientists VABolotov, OSGazman, NVGorshunova, MVGoremiko, AMNovikov, etc., world scientists, namely foreign researchers Lerner, M.Richard, etc., pay attention to the issue of educational management in their research. They scientifically and practically substantiated and studied the problems of improving the quality of education, its methodology, methods and tools, and the features of

^{75 75} *Kurbanov Sh .*, Seytkhalilov E. Management of the educational system. - T.: "Turan-Iqbal". 2006. - p. 101.

cognitive and moral development in education. While many scholars emphasize the importance of the quality of education in educational management - a complex process consisting of a combination of its characteristics, the most convenient methods for the student's learning and personal development, in this regard, researcher Yu.A. Konarzhevsky puts forward the idea that quality management in educational institutions begins with work with people, primarily with teachers, and ends with work with personnel, increasing their professional level. In fact, quality management itself is improved on the basis of monitoring, which implies monitoring and diagnosing the situation based on organized, targeted monitoring, available information sources, specially organized studies and quality control measurements.

The state of the proposed system or its individual elements corresponds to the interests of the public and parents in meeting the educational needs, in which information is collected, processed, stored and distributed. Continuing the above ideas, Sh. Kurbonov, E. Seytkhalilov define education quality management as a system that arises as a result of the influence of certain social and pedagogical conditions and includes multifunctional tasks, while Russian scientists V. Panasyuk⁷⁶ and M. Potashkin²² complement their ideas and consider education quality management as a multidimensional flexible system aimed at satisfying the social order of developing a competitive specialist.

of educational quality management⁷⁷ given by AISubetto and NASElezneva in scientific research is justified, stating that educational quality management is the management of the quality of all objects and processes in education. In this regard, OLNazarova's recognition of educational quality management as the management of processes, procedures and practices that lead to an increase in the quality of knowledge and the level of literacy is also important. In this regard, if the knowledge acquired as a national educational initiative in the management mechanism for the development of gifted students and creativity in specialized schools is successfully implemented in practice, quality will be achieved.

It is known from world experience that the quality and efficiency of education are the main factors determining the development of a state and society. Therefore,

⁷⁶ V. Panasyuk. Shkola i kachestvo: v ybor budushchego. – SPB.: KARO, 2003-384.

⁷⁷ Subetto A.I. Sociogenetics: system genetics, social intelligence, formative genetics and world development (M., International Fund N.D. Kondrateva, ITs PKPS, 1994, 168p.)

the state's spending on education and its efficiency is an investment in human capital, especially through talented and capable students, which meets high international standards, as a result of which the state will progress, society will develop, and the interests of the nation will achieve higher indicators.

So, continuing our thoughts, the importance of the national educational initiative in the management mechanism for the development of creativity of gifted students in specialized schools is explained, developing educational quality management. It is educational quality management, which serves to achieve pre-guaranteed, predictable results of education. From the point of view of student education and creativity, it is a person-oriented management, which consists of ensuring the quality of teaching, designing lesson activities, achieving quality efficiency through systematic motivation of participants in the educational process, determining indicators that do not deviate from the main goal, monitoring changes on the basis of openness, and is a system of continuous improvement of all areas of the educational institution's activities, that is, on the basis of self-assessment.

In the management mechanism for the education and development of creativity of gifted students in specialized schools, the national educational initiative is not only an important condition for the quality of modern education and its management, but also for the development of society, determining its intellectual, spiritual, cultural,⁷⁸ and educational levels. Taking into account that the intellectual potential of the country is provided by the quality of national education, continuous improvement of the effectiveness of education and management, introduction of changes in accordance with international standards, and implementation of innovative approaches in practice significantly increase the dynamics of its development. From the above social and pedagogical foundations for the stages of education quality and its management, it can be concluded that it is a constantly evolving concept, a comprehensive management mechanism, and a sectoral direction, focusing on its flexibility in accordance with the requirements of each

⁷⁸ Rakhimov M . . “ Education institutions in the system of the youth creative activity increase factors ” “ Language and island oath ” education ” scientific and methodological magazine in 2024 . Issue 11 ISSN 2010-5584.

6
 period. According to the results of the analysis of the reviewed and observed literature, based on today's requirements, In the management mechanism for the development of creativity of gifted students in specialized schools, we defined the national educational initiative as follows: **a gifted student is the net capital of the country, the quality of education and upbringing for him is an important process in increasing the effectiveness of education, guaranteeing the professional and personal competence of participants. The continuity, continuity, consistency, final quality education based on specialist and professional development in the national education system is guaranteed by the effectiveness of education** [48.234]. Then, the educational and educational activities of an educational institution are evaluated in accordance with the requirements of consumers through the main criteria and indicators, which are considered the most important condition for ensuring the modernization of content, form, methods that ensure the competences of educators and students, and improving methodological, material and technical support based on the principles of cooperation. It accelerates innovation processes, eliminates conflicts in the interaction of educational objects and practical processes . Quality management of education provides high efficiency in achieving the intended target activities of all entities aimed at ensuring the development of the education system. Through sustainable operation, a national educational initiative is implemented in the management mechanism for the development of creativity of gifted students in specialized schools. This system further improves its management through direct development and implementation.

Since the educational process is constantly developing, its achievements, problems and gaps should be regularly analyzed. The purpose and expected result of teaching indicate the quality of education. For example, through pedagogical diagnostics, the student's capabilities are studied Figure 2.5.

Figure 2.5. Duration of pedagogical-psychodiagnostic examination

Pedagogical diagnosis in education - the need for a qualified pedagogical diagnosis requires the teacher to thoroughly study the methods and special

methodologies for studying the student's personality, that is, the characteristics of a collective, holistic pedagogical process. Diagnosis is a general requirement for solving the goals and objectives of education (or upbringing). It is closely related to the clarity and uniformity of goals, methods of their implementation, measurement and assessment.

In didactic and methodological research, the initial research, the knowledge gained as a result of it, and at the same time the study of the content of the problem of designing students' creative activities in education have a number of advantages. Such an analysis provides clarification of the student's ideas about the problem and a comprehensive understanding of the relevance of the topic.

Rapid diagnosis is the study of the mental state of a student or group of students at a certain time and the analysis of their verbal and written responses.

Continuous diagnosis is understood as the study of the overall state of the educational process, shortcomings in student behavior, the individual characteristics of a group of students or an individual student, and the content of educational activities.

§ 2.2. Integrative and creative approaches to management technology for the education and development of creativity of gifted students in education

Consistent measures are being taken in the country to support promising youth, realize their talents, and create conditions for effective research and innovation activities.

At the same time, there is a need to identify talented young people and improve the continuity of training highly qualified personnel in order to increase the desire for knowledge and intellectual potential of the growing younger generation, as well as to further enhance the prestige of our country in the international arena.

The Decree of the President of the Republic of Uzbekistan No. 158 dated September 11, 2023,⁷⁹ on the “Uzbekistan – 2030” strategy, outlined his views on “creating appropriate conditions for every person to realize their potential.” The development of a developing society and improvements in people's lifestyles are unthinkable without the active integration of education, science and production, in

⁷⁹ Mirziyoyev Sh. “Uzbekistan – 2030” To the Decree of the President of the Republic of Uzbekistan dated September 11, 2023 No. PF-158 . Xalq so 'zi newspaper.T. 2023- y. September 12.

particular, in a rapidly changing era, it requires integrated and creative approaches to the management technology of the upbringing and development of talented students and their creativity, at the same time, our country has set itself the goal of taking ⁸⁰a strong place among advanced, developed countries. In recent years, Uzbekistan's rapid development has been recognized by the world community. In his 2020 Address to the Oliy Majlis, the Head of State emphasized that "to achieve progress, it is necessary and imperative for us to master digital knowledge and modern information technologies. This will allow us to take the shortest path to progress," and set the task of transitioning to a digital economy within the next five years as a firm goal.

It is no coincidence that in the Address of the President of the Republic of Uzbekistan Shavkat Mirziyoyev in December 2022, it was stated that 2023 will be named the "Year of Attention to Humanity and Quality Education" in our country, and that improving the quality of education is the only correct path to the development of New Uzbekistan.

"Salvation is in education, salvation is in upbringing, salvation is in knowledge. Because all noble goals are achieved through knowledge and upbringing" ². Figure 6

Figure 2. 6. Effective ways to achieve educational goals.

Of course, the achievements are ours. But there are also many priority tasks ahead of us. Consequently, today's times are changing rapidly, posing extremely urgent and complex tasks to the education system, along with all other sectors.

At the same time, it can be said that in the management technology of developing the creativity of gifted students, "talent" represents outstanding abilities with high potential, which allows achieving the most significant results in a particular field of activity. ⁸¹At the same time, there is a need to identify talented young people and improve the continuous system of training highly qualified personnel in order to increase the desire for knowledge and intellectual potential of the growing younger

⁸⁰ Mirziyoyev Sh. "Uzbekistan – 2030" To the Decree of the President of the Republic of Uzbekistan dated September 11, 2023 No. PF-158. Xalq so'zi newspaper. T. 2023- y. September 12.

⁸¹ Resolution of the President of the Republic of *Uzbekistan* No. PQ-4306 dated 03.05.2019 "On measures to identify talented youth and organize a continuous system of training highly qualified personnel". Xalq so'zi gazetas. T., 2019.

generation, as well as to further enhance the prestige of our country in the international arena ⁸².

According to domestic and foreign researchers, regardless of the area of talent of a student, the most reliable characteristics are a high need for a hobby and the pleasure that the student receives from it. Such purposefulness serves as one of the clear indicators of the manifestation of their talent. Today, unfortunately, not every young person who has outstanding talents in various fields of activity can successfully adapt to the life of modern society. To do this, we must set ourselves the task of further improving the quality of education, in particular, developing and improving existing educational and normative documents (European and “ *WorldSkills* ” standards ⁸³ and integrated education in the form of management), digitizing the public education system, conducting scientific research and foreign cooperation, etc. are vitally important, in particular, special attention is paid to identifying and educating gifted students and developing their creativity. This issue is especially relevant in the educational process due to the need for personal development. As a result of the emergence of new technologies, the need for personnel who can think non-standardly and analyze the information received, as well as bring new content to the development of society, is sharply increasing.

When considering the integration and creative approaches, we will give a separate explanation of both. The term ⁸⁴*integration* in practice studies the processes associated with the unification and harmonization of two or more subjects around a common goal. The integration process includes compositional and communicative components that affect each other at different levels. While the compositional components are related to the content and structure, it is necessary to identify and systematize the informal and normative boundaries of the merging subjects. In this case, the communicative component changes not only the form of the relationship between the content and subjects, but also their principles and mechanisms in completely new conditions.

⁸² Resolution of the President of the Republic of Uzbekistan No. PQ-4306 dated 03.05.2019 “On measures to identify talented youth and organize a continuous system of training highly qualified personnel”. T.-Xalq so'zi newspaper 2019.

⁸⁴ O'. Askarova and others Annotated dictionary T; - Navruz 2023

The role of integration in the education system is increasing, it is reflected in the management system of educational institutions, in the results of the development of all subjects at all stages of education, from educational activities to continuing education, and in their creative and scientific abilities. This process, in the traditional educational strategy, which is limited only to the acquisition of the necessary knowledge and skills, does not satisfy the needs of the individual in the adoption of universal and cultural values, but also contributes to the development of the individual as a cultured and competent person. If we list the role of integration in the education system, one of them is integration in the educational process, the second is the problem of implementing various creative approaches NBIC- (nano) methods in practice, which has been interpreted differently in research and scientific sources.

The practical processes of the system, including the management of specialized schools and the introduction of integration approaches in modern education of gifted youth, arise through the targeted use of various methods and technologies in conducting applied research. This process requires knowledge of the historical development of integration, observation, analysis, and project-based approaches related to its appropriate implementation in the education system.

Observing many scientific studies, we can agree with the opinion of researcher O. Jabborova⁸⁵ that integration in education is a process that reforms the general structures of education, guides learners to understand and perceive the information provided, and helps them form concepts and ideas about the interconnectedness of all processes in the world, and these ideas should be developed and implemented.

The scientific status of the term integration in education was first given in the 17th century in the theory of integral calculus, where integration was considered, on the one hand, as the inverse process of differentiation, and, on the other hand, as a specific type of unification.

The idea of integration in education⁸⁶ was put forward by Ya.A. Comenius, who believed that the development of a person's cognitive abilities and an attentive attitude to the world around him is not a process that forms by itself, but requires the

⁸⁵ O. Zhabborova Issues of integration in secondary education . ACADEMIC RESEARCH IN EDUCATIONAL SCIENCES VOLUME 2 | ISSUE 4 | 2021 ISSN: 2181-1385 Scientific Journal Impact Factor (SJIF) 2021: 5.723 DOI: 10.24411/2181-1385-2021-00651

⁸⁶ Yes. A. Komensky Ya.A. Great didactics. Moscow, Moravia 1932,

organization of classes with the purposeful and conscious use of pedagogical technologies appropriate to the content and content of the lesson. In this case, the teacher focuses on the goal of expanding the learner's worldview. These are more integrated classes, and when organizing them, the teacher must master a number of aspects specific to interdisciplinary integration. It should be noted that integration in education is the integration of parts or elements into one whole. The word "integration" was explained by Spencer in the 18th century. Before implementing integrative education, it is necessary to form a certain understanding of its classification - the division of integrative education into classes (classification). However, this multifaceted concept was explained by Spencer as early as the 18th century. From the point of view of scientists, integration is considered the most important concept in social pedagogy, and its theoretical foundations can be seen in the scientific research of BM Kedrov ⁸⁷, NV Kuzmina ⁸⁸, VA Lektorsky ⁸⁹, VNMaksimova ⁹⁰, APO Gurov ⁹¹, AIR Akitov ⁹², VS Stepin ⁹³, MG Chepikov ⁹⁴, BGYudin ⁹⁵ and others.

Currently, this scientific concept has also been incorporated into the context of pedagogical science, and ⁹⁶definitions of it are given in the scientific studies of A.Ya. Danilyuk, NIKondakov, and Yu.S. Tyunnikov.

⁹⁶ A.Ya. Danylyuk Spiritual development and education. Monitoring results. Method. skill 1 cl. FGOS

in detail: **<https://www.labirint.ru/books/356349/>**

If we clarify these definitions, integration is described and interpreted as “principle, process and result”, “unification of the whole of scattered parts” instead of “integrity, wholeness, systematicity, generality”. B.M.Kedrov emphasizes that in relation to education, the integration of disciplines should be understood as a form of their mutual relations and complementarity ⁹⁷. According to the scientist, the concept implies the existence of common research goals and objectives in different areas of knowledge, the need for a certain unified system of knowledge tools to solve and implement the problems in it.

Doctor of Pedagogical Sciences, RAMavlonova, expresses this classification as follows:

- courses based on borderline disciplines;
- courses based on basic subjects;
- courses based on general scientific concepts, laws, and theories;
- courses that address issues related to the development of science, study nature from a scientific perspective, and explore the scientific view of the world;
- courses operating on the basis of complex facilities, etc.;
- based on practical activities, he says.

Therefore, the integration in primary education, which is emphasized in this study, focuses on: reading, mathematics, science, art, labor, and English.

A teacher who organizes his lesson in an integrated manner selects tools and technologies that are appropriate for the age, level of intellectual development, and, of course, interests of the students.

It is a natural process for an integrated lesson plan to relate to a specific issue of the curriculum and the thematic plan, and the goal is to deepen knowledge and differentiate the learning process, which determines the level of mastery of the subject among gifted students in particular and students in the class in general.

In this case, the integration lesson differs from traditional lessons:

- clarity, conciseness, density and dense volume of reading material;
- full and logical coherence of the academic subjects integrated within each stage of the lesson;

⁹⁷ B.M. Kedrov "Vzaimodeystvie nauk. Theoretical and practical aspects" 1984.

is distinguished by the presence of new information in the learning material provided .

Another approach to managing the education system in this regard is creativity. New views, teaching methods require effective approaches to planning lessons in advance. This lesson helps to form critical, creative thinking in students, creates an environment for them to think creatively, come up with logical ideas, changes their personal attitude to learning, and serves to motivate children to achieve success. We know well that the main factor lacking in educational activities is creative management, which is considered a criterion for the creativity of the lesson.

To fully understand the general nature of the process of developing creative qualities in the stages of person-centered education, it is first necessary to understand the meaning of the concept of "creativity" .⁹⁸Ken Robinson (Azzam, 2009) and According to Drapeau Patty , "creativity is a set of original ideas that have their own value" and the ability to create new creative ideas.⁹⁹

Gardner¹⁰⁰, in his scientific research, explains the concept as follows: "creativity is a practical action carried out by a person, which should reflect a certain novelty and have a certain practical value." Many studies put forward different views on the relationship between intelligence and creativity. While some groups of scientists argue that there is no connection between intelligence and creativity, others try to prove that creativity and intelligence are related (Kim, 2005). The concept of "creativity" reflects cultural diversity.

In Western philosophy, creativity¹⁰¹ is considered to be novelty. They draw attention to the presence of such aspects as unconventionality, curiosity, imagination, a sense of humor, and freedom in the content of creativity. (Murdoch, Ganim, 1993; Shternberg, 1985). In the East, on the contrary, these views interpret creativity as a process of rebirth of goodness (Hui, Sternberg, 2002; Rudovich, Hui, 1997; Rudovich, Yuye, 2000). Although Western and Eastern views on creativity

⁹⁸ Pedagogical terms dictionary T .,- 2008. p. 64

⁹⁹ Drapeau Patty. Sparking student creativity (practical ways to promote innovative thinking and problem solving). – Alexandria – Virginia, USA: ASCD, 2014. – p. 4.

¹⁰⁰ Gardner, Howard . The unschooled mind [Text]: how children think and how schools should teach / H. Gardner. -[New York]: Basic books, [1991]. -XII, 303 p. -Ind.: p.293-303. - ISBN 0-465-08895-3

differ, representatives of both cultures evaluate this type of activity as a qualitative indicator and its effective result (Kaufman, Lan, 2012). According to Patti Drapeau, creative thinking is, first of all, comprehensive, creative thinking on a specific issue.

In the process of observing the learner, one cannot deny the need for a holistic approach to the problem posed. On the contrary, in such a situation, the holistic thinking of the learner is of primary importance in the formation of creativity. In the lesson, the task is to complete, come to a conclusion, the learner searches for several options for a solution (multifaceted thinking), and then stops at only one correct solution that guarantees the most optimal and fastest result (unilateral thinking). Based on the above considerations, the concept of “creativity”¹⁰² can be interpreted as follows: Creative (lat., eng. “create” - creation, “creative” - creator, creator) - a product of the individual's creative ability, which characterizes the readiness of the individual to generate new ideas and is part of the composition of talent as an independent factor. The creativity of a person is manifested in his thinking, worldview, communication, feelings, and certain processes of activity. Creativity itself characterizes the individual as a whole or its specific features. Creativity in students can also be reflected as an important factor in their ability to work. In addition, creativity determines the sharpness of a person's mind, "ensures the active involvement of students in the educational process" and research.¹⁰³

If creativity is an essential factor for a learner, then in the process of managing education, teachers who organize it also determine the presence of creative qualities in themselves and their level.¹⁰⁴ If we turn to education in foreign countries, the scientist E.P.Torrens¹⁰⁵ developed a test in 1987 that determines the individual's creative thinking. This test makes it possible to assess the individual's creativity and its level according to criteria such as activity in organizing creative activities, quick thinking, originality and perfection.

¹⁰⁵ E. P. Torrens. Gifted and talented children in the regular classroom. Buffalo, NY: Creative Education Foundation Press. 12. Torrance, EP (1994). Creativity: Just want to know. Pretoria, Republic of South Africa: Benedict Books. 13. Torrance, EP (1995)

In the lesson process, the teacher evaluates the answers given to the questions proposed to the student based on these four criteria. According to E.P. Torrens, the concept of "creativity" includes the following: - initially putting forward a problem or scientific hypotheses; - testing and changing the hypothesis; - identifying the current problem based on the formation of the results of the decision; - finding a solution to the problem, sensitivity to the contradictions between existing knowledge and practical actions. Creative thinking can be clearly reflected in every area. It is visible in the teacher's activity in the lesson, in the upbringing and creativity of the student. Both manifestations depend on how the activity is organized, on the creative (creative) approach.

As is known, in the modern system of education and management, this situation is expressed by the concept of "pedagogical creativity". What is pedagogical creativity? It is a professional ability of a teacher in the process of activity, which serves to ensure the effectiveness of the educational and upbringing process, in contrast to traditional pedagogical thinking, the ability to create new methods, new ideas, as well as the readiness to positively solve existing pedagogical problems within the framework of the situation.¹⁰⁶

"Creative Pedagogy" requires its participants to be able to guarantee the following two conditions (Figure 2.7):

Figure 2.7. The structure of professional abilities in students.

In this:

- 1) work by creative teachers to attract the attention of students who are poorly mastering academic subjects and who find them boring to master the basics of science;
- 2) to create opportunities for students to effectively use strategies and tools that serve to stimulate creative thinking and creative activity within the subject by systematically recommending them.

If the teacher does not have creative qualities, a number of difficulties may arise for the learner. In the lesson, students cannot express their interests and, despite

¹⁰⁶ 106 Sh.Mardonov. Possibilities for developing the creativity of future teachers. T., 167- B

having great ideas, are slow to express them openly and express their thoughts. When analyzed, the reason for this is that the interactive methods and new methods used in the educational process do not serve to form free, independent thinking skills in students.

The scope and strategies of lessons based on integrative and creative approaches in specialized schools, especially in creative schools, also provide great opportunities for teachers to develop creativity in students. The expected result is the systematic development of interest and aspiration in students to study academic subjects.

In the implementation of the NBIC-(nano)s method of integrated and creative approaches to the management technology of the upbringing and development of creativity of gifted students in education, this concept is realized in the context of the modernization of the education system through its integration, creative approaches and is considered an innovative paradigm in teaching, creating and implementing the opportunity to form a creative, competitive personality within the framework of the inseparable, mutual relations and cooperation of types of education.

Two important features of integrated and creative approaches in education are :

- education as an integrative tradition in the development of science and culture with the aim of forming an integral knowledge system of the younger generation in the general view of the world;
- and recommended as an integrative general subject in the communication and relationship of human activity with the world .

As a result of the research, it was analyzed that the integration and creativity processes have been described differently in many studies, and it was found that while they support each other, they also have different aspects.

integration and creative processes began to develop actively at the beginning of the 21st century . As the main need for modernization of education, special attention is paid to the development of innovative development trends in this area, the development of a new generation of educational programs and educational literature, the application and introduction of integrated technologies in the field of management. The result was the emergence of integrated educational institutions of continuous education, namely preschool education +

general secondary education, school + academic lyceum, professional education, school + higher education. All this, according to researcher V.N. Maksimova, leads to the assessment of integration as a “principle and factor in the development of modern education systems”.

As a result of our observations, we are convinced that it is necessary to pay attention to two aspects of integration in the field of pedagogy: *the first* is the mutual integration of the continuous education system, *and the second* is the integration of the quality of education, its content, which is somewhat appropriate.

¹⁰⁷In the studies of scientific researchers, T.Yu. Lomakin, NMBelyankova, VAIgnatova, VNMaksimova and others, it is emphasized that it is effective to establish interdisciplinary or intersubject connections in educational processes by organizing integrated thematic sections or modules, which we also considered one of the most acceptable ideas in achieving the goal of this study. In some scientific studies, improving the efficiency of education, managing the system and providing the learner with a high-performance process that determines its result, is considered as providing theoretical and practical foundations.

It was emphasized that in achieving this goal, supporting the description of integration given above, it is an effective way to implement the educational process through interdisciplinary, inter-thematic, and inter-departmental integrated methods to ensure a student with a high level of knowledge.

of world scientists as a factor in the management of the educational process and its effectiveness as a result of the integration and creative approaches in education. Such modern methods in the field of education have a positive effect on the theoretical and practical significance of the lesson. In terms of management activities, it is important to use resources purposefully, to attract all resources in the material and financial, technological, informational, methodological and personnel spheres to ensure the necessary needs.

are constantly needed in the management of specialized schools, in the form of nano-methods . They are mainly manifested in educational management as a concept and content. Such activities are considered a school of joy and talents, organized in a democratic management style, based on the harmony of modern and national values.

¹⁰⁷ T.Yu. Lomakin. Innovative data and professional education; M. 2007.

¹⁰⁸According to IEKashekova, who emphasized the inevitability of deep integration processes in modern education based on her scientific research and observations, “the modern world as a whole is built on the basis of integrative harmony, which is subject to the laws of multifaceted knowledge, competencies, and the correct selection and correct use of information flows.” Based on these ideas, it can be concluded that education is built on an integrative basis or helps a person to master the world at the level of his worldview and capabilities when introducing a person to the world. In the system of continuous education, along with the presence of theoretical and scientific foundations in the integration of science and production, the expected practical results are also sufficiently present. If we consider, first of all, in the system of training competitive personnel with a place in the labor market, it is of great importance to ensure the integration of science, education, production and economy. In this regard, the quality and quantity of personnel being trained provide for the requirements ordered and established by the state, as well as systematic mechanisms for the formation of social orders of consumer organizations. The sphere of training potential personnel, which is the basis of education in the development of society, is at the same time a priority mechanism for meeting both economic and social needs. In this regard: the economic needs of the individual, society and the state connect the production and scientific and technical needs of science and serve to provide it . By increasing the efficiency of education and upbringing and strengthening its impact on management, there is a need to further improve the following problems through an integrated approach. In this regard:

Figure 2.8:

- the lack of systematic links between the education system and the labor market in society;
- Insufficient efficiency and connection of "education, science and production" within the framework of labor activity;
- stabilize and increase the level of integration by improving the scientific and practical pedagogical foundations of personnel training in accordance with the changing labor market;

¹⁰⁸ I.E. Kashekova "Isobrazitelnoe ikusstvo". M.: 2014 -112 p.

- Based on constant needs, the necessity², essence, and gradual increase in the efficiency of the educational services market.

When thinking about the method of integrative and creative approaches to the management technology of the upbringing and development of creativity of gifted students in education⁴, the integration of teaching is also the basis for changing the content of education.

2.8 . Integration structure for improving the effectiveness of education .

From the above definitions and descriptions, it can be understood that in implementing the method of integration and creative approaches to the management technology of the education and development of gifted students, management creates a whole through the concepts of continuity and consistency . Such principles are studied through integration and creative approaches to the management technology of the education and development of gifted students . Also, the integration of activities is further accelerated, the effectiveness of such features serves the quality of education. At this point, the question arises: what will be the result? As is known, the systematic development of each sphere or industry is carried out, first of all, through three factors, namely: mutual cooperation, complementarity, and integration⁴ of education, science, and production processes. Such integration of these three will become the basis for the future innovation processes of not only the spheres, but also the sphere of education .

It is known that management processes always need innovation and scientific approaches, which also applies to different levels of production, and its correctness is beyond doubt. Because production is no longer limited to its narrow sphere of competence. Perhaps, it is expanding the possibilities of scientific methods and highly qualified personnel. Therefore , science cannot exist separately from production . The era of “pure” scientific experiments has passed, “science for science’s sake” is a dead formula, and now practical experiments have proven that only by following the path of science and production can high results be achieved.

Integration is based on the law known as synergy (from the Greek "synergos" - "coordinated", "mutual partner"). According to the law of synergy, no entity can combine all the aspects that serve to ensure the effectiveness of its activities, it²

always needs to cooperate with other entities. The combination of these aspects in different entities serves to increase efficiency.

analyzing the literature , the types of integration were classified as follows:

1. the integration directions of development : horizontal , vertical, diagonal.
2. According to the level of integration: mutual cooperation, cooperative and full integration.
3. Within the scope of activities : production, scientific, educational, marketing, investment and innovation integration.
4. According to the legal basis: joint-stock and joint-integrated.

Based on the classifications we have reviewed, it can be considered appropriate to define the vertical direction of integrated development in science, education and production, economic activity and management, as interaction according to the level of integration, and production, scientific and educational integration according to the direction of activity.

Cross-sectoral integration is broader in meaning, that is, it covers several areas of public administration and they are combined in activities to bring education, science and production closer together. If we consider the management technology for the development of student education and creativity as a methodology of integration and creative approaches within the framework of the coherence of science, education and production, economic activity, we consider pedagogical potential and skills, a modern innovative environment, the quality of integrated education, and aspects such as “ *school + creative laboratory* ” as a guarantee of practical activity in the effective implementation of the integration of education, science and production .

Namely, “ *schools are creative laboratories* ” or Specialized schools and boarding schools are state educational institutions that provide for the professional orientation of students in specialized subjects and their targeted preparation for further study in higher educational institutions or for employment, and implement the educational process in accordance with the requirements of state educational standards, state educational requirements, curricula and educational programs. Through the mentioned components, the level and role of scientific and pedagogical

potential in the training and management of competitive personnel, such aspects as development-based, modern, innovative, modeling, and the harmony of theory and practice, which are important for the integration process, are reflected, in addition, in-depth and professionally oriented education of students in specialized subjects, ensuring their intellectual maturity and spiritual development, and educating them in a spirit of high patriotism, in a word, the goal of the activities of specialized schools.

In the process of integration, specialized schools operate in a systematic sequence of education, science and production. This is a natural process. The fact that science precedes education, and production precedes science or education, indicates that there is no real relationship and integration process between these areas. The above relationships prove that science is based on the principle of “science for science’s sake”, which is separate from development and life, and that the harmony of theory and practice is not ensured in education, and production is based on life experiences rather than scientific achievements. These relationships lead the areas to a certain degree of development, but this cannot be called competitive production relations that meet modern requirements. According to sources, in order to ensure integration, two or more educational disciplines and their home -

The fact that the consumer attitude towards science is consistent with scientific logic, in turn, indicates the level of the scientific-pedagogical potential component in an integrated relationship - the superiority of scientific potential over representatives of the production sector in the field of science and education.

In the context of society, the purposeful integration of education with science, production, and the economy is considered not only a factor that increases the efficiency of education, but also a driving force for the economic growth and social development of the state. This is an effective partnership (see Figure 2.2.9).

In the context of education, improving the integration between types of education is reflected in the organization of innovative models aimed at improving the quality of teaching subjects by attaching professors and teachers of higher educational institutions to general education schools. Through the application of theoretical knowledge by the learner in practical processes, it becomes clear that the relationships “man-technology”, “man-society”, “science-nature” are the main process. As a result of integration between types of education, the learner acquires

Figure 2.9. Education in its social context integration process module.

The competencies will help him overcome problems he may encounter in his post-education career and contribute to his professional maturity.

The successful aspects of analyzing the processes of managing the creativity of gifted children in education based on an integrative approach can be predicted as follows:

- learner integration approaches in educational processes imagines as a whole, as a whole;

- The student studies the world and nature according to his/her abilities. Through this, he/she thinks logically and independently observes existing phenomena, causes and their solutions. As a result, his/her ability to communicate, compare, contrast, generalize and draw conclusions, and his/her level of thinking systematically develop;

- In collaborative learning processes, a teacher's professional competence develops based on results.

Therefore, organizing lessons in an integrated manner guarantees the quality of the lesson and the comprehensive development of students' worldview. When conducting integrated learning processes, it is first of all advisable to provide students with inter-disciplinary and inter-thematic connections.

Otherwise, the student may encounter misunderstandings during the integration process, fall into an abstract state, and reach incorrect conclusions at the end of the process.

During the study, it was predicted that the organization of continuous process integration based on a cluster approach in the development and implementation of competency requirements across types of education would yield high results, and improving teacher knowledge, identifying student talents, diagnostic analysis, and development in increasing educational efficiency were proven in the practical experiences in the next chapter.

Looking at the processes of managing the creativity of gifted children in education as an integrative activity, it assumes that each subject achieves the following goals:

development and application of innovative methods to science through an integrated approach to the processes of managing the creativity of gifted children in education;

It is necessary to use the capabilities of all interested partners in the processes of managing the creativity of gifted children in education;

In the processes of managing the creativity of gifted children in education, methods of effectively using available resources to achieve their specific goals, based on general goals, etc.

In conclusion, the conditions for rapid development in the processes of managing the creativity of gifted children in education are manifested in the following:

The process of managing the creativity of gifted children in education involves the assimilation of knowledge, the formation and development of human capital by a person who is a participant in the production process;

substantiates that managing the creativity of gifted children in education is an important factor in ensuring the level of education of members of society, the socio-economic development of the state, and the well-being of the population;

It proves that achievements in the processes of managing the creativity of gifted children in education occur as a result of the country's economic development, the strong influence of human knowledge, etc.

The following types of activities can be distinguished at different levels and directions of integration, which is considered a priority factor in educational effectiveness :

specialized school education and science with world science;

of the specialized school education system to the integration of science and production ;

of the specialized school education system at the state, regional and institutional levels;

cooperation of the specialized school education system with educational institutions in various fields ;

integration of all types of education in the labor field of the specialized school education system into a single system of continuing education , etc.

The teaching system of specialized schools includes interdisciplinary integration (the coherence of subjects in the general education curriculum), inter-subject and intra-subject integration of knowledge (the coherence and consistency of subjects based on a particular subject);

integration of teaching methods, technologies and forms, methods and means of their organization in the specialized school education system ;

integration of various participants in the educational process of the specialized school education system into a single educational space (teachers, learners , parents, special socio-cultural groups (disabled people, migrants), etc.);

integration of the upbringing and culture of all participants in the specialized school education system (leader, employee, educator, learner, parent, social order applicant), etc.

The process of integrating the education system was implemented on a cluster basis, that is, in stages, and a number of scientific, methodological, organizational and practical works were carried out to reform it in the research. As a result of these efforts, positive results were achieved in further improving the competencies of participants in the educational process and increasing the effectiveness of education.

Therefore, the quality of education can be improved through the following integrated didactic management options:

The specialized school education system aims to ensure the integrity of the knowledge, work style, abilities and qualities of future specialists, thereby achieving a combined, integrated mastery of pedagogical and technical knowledge by students in the process of directing them to the right profession and preparing them for professional activity (this opportunity is effective in providing a mature, competitive specialist);

in specialized schools , realistic planning, design, technologization of the educational process, and the use of selected methods and tools in a coherent and consistent manner to achieve the set result (this serves to achieve high results in the quality of education);

in the specialized school education system on the basis of interdisciplinary, cross-subject, cross-course and cross-departmental individualized, differentiated and specialized education (which serves as a guarantee of the student's future professional success);

conducting the educational process in the context of the integration of the specialized school education system , with organizational forms and methods, conditions that effectively organize it, and the methods and technologies used (this ensures high-quality education);

specialized schools education system To develop student thinking and creativity, it is necessary to integrate the components of personally oriented education, such as problem-based learning, individual work, strengthening motivation, orientation towards independent learning, self-development, control, and evaluation, that is, to reveal the child's talents.

§ 2.3. Formation and management of students' creative activity through educational games and interactive lessons

The fundamental changes taking place in society undoubtedly also cover the sphere of education and have a positive impact on its content. At the same time, some shortcomings in ensuring the connection and continuity between types of education in the sphere of personnel training within the framework of the national education strategy have led to fragmentation in goal setting and a decrease in the quality of education. An imbalance has been observed in the state policy on personnel training, its distribution across regions. In order to eliminate shortcomings in the education system, a number of decisions have been made in recent years in the spheres of education and national personnel training.

The above-mentioned issues in the education system can find a positive solution as a result of systematic work on this issue by regional administrations and relevant departments under their jurisdiction. In turn, the creation of a new mechanism in the education system has become a vital necessity, which would ensure mutual control, competition, and satisfaction of interests between types of education ¹⁰⁹. Based on the high social importance of education in the sustainable development of society, it is necessary to enrich the types of education and the content of education through modern technologies in order to meet modern requirements, problems in the system, and solve them. Our President Shavkat Mirziyoyev, ¹¹⁰during his conversation with educators on December 29, 2022, paid special attention to the following points. “We have not been engaged in education, schools, and textbooks for more than twenty years. Well, who has benefited from this?” the President asked. At the meeting dedicated to improving the quality of

¹⁰⁹ Mirziyoyev Sh. Resolution of the President of the Republic of Uzbekistan on approval of the national human rights education program in the Republic of Uzbekistan, No. PQ-46 dated 07.02.2023

¹¹⁰ People's Word Newspaper. December 29 , 2022 .

education, the head of state once again emphasized the importance of today's topic, saying, "Today we will talk about improving the quality of education, about new textbooks. Well, who will deliver these new textbooks to our children? Of course, teachers! I am not talking about raising the status of teachers in vain. In today's era of globalization, we are realizing even more strongly how important education is, the well-being of the future generation. Today, our youth, our students themselves are demanding, "We do not need yesterday's education." We are planning our current reforms, setting big goals. They are easy to say, but difficult to implement. But no matter how difficult it may be, we must work to implement these reforms for our children, he emphasized.

Since today's aspiring, creative students will become our golden fund in the future. We are proud of their achievements. At this meeting, when they spoke about the main tasks of teachers, they said, "What contribution am I making to my beloved homeland?!" The answer to the question is that we work on ourselves and the development of our children, - the fact that they gave the answer themselves encouraged scientists to be even more dedicated to their profession. Therefore, a modern approach to education and new methodological and didactic methods are necessary. Based on the essence of our work, in our scientific research work , we focused on improving the quality of education based on the development of students' creative activity through educational games and interactive lessons . First, it is necessary to analyze the definitions given in terms of the concept of an educational game, its historical development and periodic changes. The educational process, focused on practical results, is becoming an important aspect or even a pressing issue in today's secular education system, which is improving in accordance with the personality of the student, the student. Since our main goal is the systematic development of students' comprehensive universal learning and cognitive skills, the widespread use of game technologies as a teaching tool that increases the student's needs, inclinations, interests, and creative activity is of great importance in this process.

Especially, various educational games that are suitable for the nature of a creative, talented student can become a driving force for the educational process, leading to a qualitative result , revealing their potential, and new talents. During the

lesson, educational games allow the student not only to clearly set his goal, increase his interest in achieving victory, but also to create a strong motivation in him. The intended goal teaches the student to act quickly, to be agile, resourceful, to perform tasks accurately, quickly and qualitatively, and to form the skills of observing the rules and regulations. The lesson develops the student's all-round activity and increases his enthusiasm for new knowledge. It helps him to form moral qualities as a person. Such lessons help students develop humane habits such as cooperation, creativity, caring for each other, and mutual respect through friendship.

Especially as they are just discovering the world in its colorful light, it also creates aspects such as imagining the outside world, free thinking, emotional activity, and openness to communication.

We know that students try to help each other in the classroom, sometimes consciously and sometimes unconsciously, in accordance with the interests of others, to harmonize their personal interests with them. During these educational games, students develop the skills to apply the knowledge they have gained in practice and use it wisely in different situations. Educational game activities, based on the formation of good qualities in a student or student, create collective life activities, direct their independence, support the capabilities of others in working conditions.

Organizing educational game activities to improve the quality of the lesson will increase students' intellectual thinking and interest in learning how to properly manage the situation, which will lead to their knowledge, diligence, resourcefulness, a responsible approach to their tasks, and the achievement of new results.

What is an educational game? What opportunities does it provide for the student in the lesson?

Answering this question, educational games are a pedagogical and methodological tool for organizing and conducting the lesson process. It is also appropriate to say that they are a practical tool for learning new knowledge and necessary content in mastering the essence of the subject. Explaining the content of education to students through games is the most convenient way of explaining this.

There is a saying among experienced educators: if you tell me, I will forget, if you show me, I will remember, but if I personally participate in the process, if I do it myself, I will remember it for the rest of my life and it will be mine.

Therefore, organizing the learning process through educational games effectively guarantees understanding, learning, and mastering the essence of the topic, event, and content.

According to sources, psychologist K. Gross said, "Through play, a student forms the skills of self-control, learning the world, knowing traditions, and adapting to the environment ¹¹¹." The above ideas not only complement each other in the minds of many scientists, but also help a student to more clearly realize his potential in the development of social activity, gain certain experiences, and develop his own moral self-development and independently manage his activities.

Educational games teach students to think, be resourceful, sharpen their minds, be intelligent, and think logically. On this basis, they also help them form their own "I".

Such activities create a need for the student to fully understand the lesson, and by mastering new knowledge, they initiate changes and creativity. Thus, educational games open up new opportunities for the student's personality to communicate with the outside world. In fact, the game is a universal term, and there are specific concepts and terms in philosophy, pedagogy, psychology, historical theory, and art. In general, in the language of science, that is, in scientific language, the game is also used in the meanings of dramaturgy, performances, holidays, festivals, carnivals, and artistic creativity.

The dictionary meaning of the word is indicated in the encyclopedic dictionary that play is not only a productive activity, the motive of which is manifested not in the results, but rather in the process itself.[112]

Educational games implemented in the lesson process are intended to provide enjoyment to the players, and both participants and observers, that is, the audience, enjoy them. Therefore, they play an important role in the effective and productive course of the educational process, in which they play an important role in the development of the student as a person, in increasing his interest in work, learning,

¹¹¹ The content of organizing pedagogical education through games and forming a disciplined attitude in students. T.,-145.

¹¹² Encyclopedic dictionary. "National Encyclopedia of Uzbekistan" state publishing house.. 2010.

and knowledge in life, in becoming mentally strong, and in preparing him for adulthood.

In educational processes, the concept of a game or educational game in general has a broad meaning, and it is somewhat difficult to express it with a single definition or rule. Often, in our opinion, a broader answer can be obtained only when the question "Why does everyone play?" is asked to find an answer to this question.

Are educational games important in developing student creativity and BKM competencies through interactive lessons?

Most educators consider games as an educational tool that activates the student's ability to master a new topic and learn. At first glance, it is not a product or a type of service, but people in most cases associate their lives with constant, uninterrupted games. Why?

Educational game is a phenomenon of pedagogical and methodological culture, which is a very important tool in the full formation and development of the student's personality as a person in society, it has been of constant interest to researchers, especially as a decisive factor. In improving the quality of the lesson, educational game helps to get rid of excess energy in the student's body, to use energy usefully and purposefully during fatigue and in some cases to restore it helps. In the development of students' creative activity, educational games help maintain a person's vital balance, increase his activity, and activate inactive organs in the body. Such beneficial effects lead to the assessment that educational games create and restore good energies in the body. That is, such interactive lessons in themselves are a practical and pedagogical process that constantly develops the individual through game technologies and directs him to creative creativity. The result is that by involving the student in an educational game in a particular lesson, it allows him to prepare for further work and life activities. Observations show that depriving creative students of educational games during the lesson can have a negative effect on them as a severe punishment and lead to bad consequences. For this, the teacher must use the potential of students rationally and fairly during the lesson. In the systematic development of students' creative activity , in the organization of interactive lessons, we have conditionally defined the types and classification of educational games as follows.

Figure 2.10. Types of educational games.

Each of the games listed above has its own components. They are:

- a group of participants in an educational game;
- classification of educational game rules;
- time and limits of educational play ;
- the plot and reality of the educational game ;
- educational game props and tools ;
- the conclusion of the educational game (results, compliance with the rules).

Here are some examples of games that have been approved and used in interactive learning.

interactive and innovative methods such as “Why?”, “Fish Skeleton”, “Cascade”, “How?” can be used in all subjects . We mainly tried to conduct them in the form of business educational games , and as a result of the lesson, we witnessed the development of creative activity in students.

Sample methods:

“Nima uchun?” sxemasini tuzish qoidalar

1. Darsda taqdim qilingan o‘kuv materiali bo‘yicha qanday piktogrammadan: aylana yoki to‘g‘ri to‘rtburchakdan foydalanishingizni o‘zingiz hal etasiz.
2. Mulohazalar sxema-zanjiri turini: chiziqli, nochiziqli, spiralsimon (dastlabki holatni markazga yoki chetga joylashtirib) bo‘lishligini o‘zingiz tanlaysiz.
3. Strelka sizning qidiruv yo‘nalishingizni belgilaydi: dastlabki holatdan oqibatgacha.
4. Xulosa.

2. Figure 11. “Why?” diagram .

Social and natural sciences "Fish Skeleton" in the lesson using the method “HOW?” Hierarchical diagram

2.12 . *“How” diagram.*

2.13 . Hierarchical diagram.

1. Ko'p xollarda sizga muammolar hal etishda "Nima qilish kerak?" haqida o'ylashga hojat bo'lmaydi. Muammo asosan, "Buni qanday qilish kerak?" qabilida bo'ladi. "Qanday?"-muammoni hal etishda asosiy savol hisoblanadi. "Qanday?" iyerarxiya diagrammasi muammo haqida butunligicha umumiy tasavvurga ega bo'lishga imkon beradigan savollar mantiqiy zanjiri ko'rinishida bo'ladi. Ketma-ket ravishda "Qanday?" savolini qo'yish orqali siz faqat muammoni hal etishning barcha imkoniyatlarini tadqiq etibgina qolmay, balki ularni amalga oshirish usullarini ham o'rganasiz. Diagramma strategik darajadagi savol bilan ish boshlaydi. Muammoni hal etishning pastki (qo'yi) darajasi birinchi navbatdagi harakatlar ro'yxatiga mos keladi.

2. O'ylamay, baholamay va ularni o'zaro solishtirmay tezlikda barcha g'oyalarni yozish lozim bo'ladi.

3. Diagramma hech qachon tugallanmaydi: unga yangi g'oyalarni kiritish mumkin bo'ladi.

4. Agarda savol sxemada bir qancha "shoxlar"da qaytarilsa, demak u nisbatan muhimdir. U muammoni hal etishning muhim qadami bo'lishi mumkin.

5. Yangi g'oyalarni grafik ko'rinishida qayd etishni o'zingiz hal eting: daraxt yoki kaskad ko'rinishida, yuqoridan pastga yoki chapdan o'ngga. Eng muhimi esda tuting: nisbatan ko'p miqdordagi foydali g'oyalar va muammo yechimlarini topishga imkon beradigan usul eng maqbul usul xisoblanadi.

6. Agarda siz to'g'ri savol bersangiz va o'19 nest bo'lsangiz, u holda diagramma (texnika) har qanday muammo yechimini topib berishni kafolatlaydi.

2.14 . Views of the cascade circuit

“Kaskad” tarkibiy-mantiqiy sxemani ko‘rish qoidalari

1. “Kaskad” ni tuzish jarayonida tizimli sxema tarkibiy qismi va elementlarini oldiga surish mumkin -bu u yoki bu holatni qayta mushohada qilishga imkon beradi.
2. G‘oyalarni ishlab chiqishda agarda siz tor yo‘lakka kirib qolsangiz, u holda bir-ikki daraja yuqoriga qayting va muhim narsani unutmaganingizga hamda boshqacha nimadir qilish mumkin ekanligiga amin bo‘ling.
- 3.Siz chapdan o‘ngga yozishga o‘rgangansiz. “Kaskad qurishni o‘ngdan chapga” bo‘lishligiga 11 rakat qiling. Buning uchun asosiy g‘oyani varaqning chap qirrasiga joylashtiring.

Figure 2.15. View of a pyramid scheme.

Sxemani tuzish qoidalari bilan tanishiladi. Ikki (juftlikda)iyexomi tuziladi muammo (g'oya, masala) kichik muammolar yoziladi, keyin muammo yoki masalaning ikkinchi darajali jihatlarini chuqurroq ko'rib chiqish uchun xizmat qiluvchi "kichik shohlar" davom ettiriladi buning natijasida bitta g'oya rivojlanishining barcha tomonlari yetarlicha chuqur o'rganib chiqilishi mumkin.

Juflarga birlashadi, o'z sxer 11 arini taqqoslaydi va qo'shimchalar kiritadi. Umumiy sxemaga jamlaydi.

Natijalar taqdimoti

« Lily flower » scheme my name is solution to grow method.

Figure 2.16. Diagram of the "Lily" flower.

Bunda “Nilufar guli” obrazini mujassam etish uchun g‘oyaning asosini 9 ta katta kvadratlar tashkil etib, ularning har biri o‘z navbatida 9 ta kichik kvadratlardan iboratdir.

Tizimli, ijodiy tahliliy mushohada qilish ko‘nikmalarini rivojlantirish orqali faoliyat yuritiladi.

Sxemani tuzish qoidalari bilan tanishiladi. Yakka (juftlikda) sxema tuziladi: asosiy muammo (masala) markaziy kvadratning markaziga yoziladi. Uni hal qilish g‘oyalari markaziy kvadrat atrofida joylashgan qolgan sakkizta kvadratlarga yoziladi. Har bir ushbu sakkizta g‘oya markaziy kvadrat atrofida joylashgan sakkizta kvadrat markaziga o‘tkaziladi, boshqacha aytgandi nilufar gulidan uning gul bargiga o‘tqaziladi. Shunday qilib, ular har biri, o‘z navbatida yana bir muammo sifatida qoraladi.

Juftlarga birlashadi, o‘z sxemalarini taqqoslaydi va qo‘shimchalar kiritadi. Umumiy sxemaga jamlanadi.

11

Natijalar taqdimoti o‘tkaziladi. Masalan: Iqlim muammolari, tabiat o‘zgarishlari, anomal issiqlik yoki sovuqlik mavzulari kabilar.

Educational exercise games , theirs in personal development place about human psychology , human ethnography , It is clear that a number of scientific research works have been carried out in culture, pedagogy, and other disciplines .

In this regard, at the end of the 19th century German death K. Gross¹¹³ games system to study and work movement I did it . be , no copper psychological games KB yuller He conducts scientific research as a " satisfying " activity . Among the scientists are LSVi Gotsky , According to A. N. Leo n 'yev , games theoretically social environment I know . to the activity If you have studied and connected with the direction of the movement , DBElko 's personal behavior management content and interprets it as an improving activity. In particular, the only and most important main feature of educational games is their importance in education. In educational games, the student's behavior is freely and positively formed and socialized. The most important aspect of games is their two-dimensional character to the ground owner is, It is about performing a r t s , drama , creativity and creativity It is a bath .

¹¹³ K. Gros s . Sovremennye pedagogicheskie technologist

Consequently, in almost all cases, such lessons are taught in one go . the game participants him/ her a malga He often gets into unexpected situations and tasks with connection true activity We are amazed by their achievements , on the other hand In most cases , the purpose of educational games does not correspond to the topic of the lesson being taught, which leads to the role-playing of the child . unconsciously true from situations abroad who is it ? It also causes conditional , situational, and accidental events . To prevent this from happening, the teacher must also have the skill of selecting educational games that are appropriate and specific to the topic.

Based on the nature of the interactive lesson , elements of educational games are widely used in the learning process .

In organizing an effective lesson process, business educational games not only provides the opportunity to direct one 's career , but also the subject matter of science , its social return the content wound It also creates a curve, and this process , practice to perceive or not this to t u ri x -mas It allows you to manage and model a system of relationships .

2.17-rasm. Pedagogik ta'limning innovatsion modeli

It is clear from this that the model of management and modeling of educational games is inherently a continuous learning model. important in all its aspects science of duty Along with the performance, it brings out the student's

activity, talent, and develops creative competence. guaranteed result to take away
The fact that it is a causal factor finds practical confirmation through this model.

When conducting **business** educational **games** it's participants special activity (game in style) imitation in the model development is necessary. Such business educational games to the character according to: arrow u v process games, practical research games, situational- other - worldly view and skills certificate educational exercise games to the type These educational games are considered important in the management and development of an educational institution.

6
Specialized schools are involved in the teaching process circle educational games and reading objects based on in the future future ka s biy fa o l i ya t ini correct organization meat and person to the goal It serves to create the necessary conditions for harmonious development. Such opportunities result in accomplished, acquired new knowledge future activity correct help to set up Give it to me. It's okay, educational processes to cooperation is based on, is formed through the social character; specialized schools prepare students for their future chosen professions in these processes of the education system x -mas active rules and Teamwork skills are also related to the social rules of society. suitable and typical without a malga It is necessary to increase. Therefore, specialized schools are an integral part of the education system. didactic -motivational and moral - educational and educational activities are combined to ~~acta~~ business and educational game activity for the participants. the fact that We will try to consider these processes using the example of a lesson.

5
It is clear from this that games are included in the teaching system of specialized schools. is the main type of activity of the student, through which the child perceives social life, the world, the environment, in a word, the world in which he lives, and develops skills for adapting to it. In the educational system of specialized schools, business educational games are implemented through educational technologies and are formed as the following factors:

- first, to provide an understanding of business educational games;
- secondly, to determine the interests of participants in business educational games;

- thirdly, to create conditions for students to increase their self-management capabilities and to actively participate in business educational games and so on .

It should also be noted that business educational games are a great way to demonstrate the socio - spiritual and practical significance of this type of activity. aspect two tasks name of the task :

- *necessary and known social knowledge skills e.g.*
- *practical social step by step procedures develop.*

Business educational games are problem - based learning n u qta'i From a theoretical perspective , the student's creative abilities are activated , and his work ethic increases .

The main characteristics that are important for the participant in this case are awareness , research , initiative , independent thinking and willpower . The qualities increase .

This business educational games for a reason various socio - psychological to the description e , increases the quality of the lesson, and targeted use in the learning process undoubtedly gives the expected effect. It is appropriate to carry out active teaching methods, educational games in such stages of the lesson for a limited period of time. From one, two students to eleven students can participate in business educational games. For example, business educational games such as "Traveling Planet", "Knowledge Palace " can be mentioned .

This is a game . perspective and from a financial point of view the essence of the body from a number of foreign scholars Ya.M. B yelch i kov v, MM B irstein, VN Burkov , Yu.V. Geron i m u s, V.Ya. Platov, local psychological researchers B. Kadyrov, VMK a ri m ova, RS u nnatova, S. Ni sh onova and another day enough explanation in the research papers They used business games in their scientific research work . team T h e y d e s c r i b e d them as pedagogical and practical psychological technologies of modern education , and each of them gave a detailed explanation of the essence of their experiments in this area .

Business educational games in this regard are called "Business Literacy" (business education) games past work to the methodology effective and necessary scientific ideas about Business educational games are called by terms such as "Business" (business), active in teaching methods place n (i.e. school) Students

of the age group he /she marks it as important. Business educational games are active . school work into the methods and its classification Russian He lives in N. N. Kozlenko ¹¹⁴'s house It is described as : “ Active teaching methods ” “ Cooperation ” games , analysis of real situations and role game improvement work " The process is underway , " he said .

VMKari emphasized that¹¹⁵ " active " arrow to the methods , first of all , debate , discussion by the way skills development " The meaning of the dream is ... " , the scientist investigates.

Also, scientist V.Ya. Platov, ¹¹⁶in his scientific research, interprets active learning methods in the following aspects : business educational games from situational games consists of, says and classifies them as follows:

"Role -playing games that shape and develop the personality , interactive games , and management activities " against " organization and business skills " are games .¹¹⁷

In the above studies , the use of educational games that are called “ Business ” or “ Management ” below a s s i y I t s e p a r a t e s the edges and they look like this:

1. Object model of Availability and research . 2. Diversity and relevance of roles .

3. Situational decision a c c e p t e d job in the process role of goals mutual and fundamental difference .

4. Performers and this the roles b a j a r u v c h i of the participants positive influence on each other .

So, this type of activity, namely “R o l l i i n " games " the most f i r s t activity first , hero , hero person in the adjective show yourself It is part of the activating methods of teaching . imitation Games develop the student 's leadership and management skills . Also, depending on the child's character, games can be adapted to or rolls distribution including situations It is possible .

¹¹⁷ Educational games in primary grades and methods of conducting them - internet materials.

In interactive teaching processes , “ Working games ” are used to train pedagogical specialists and their profession . improvement is directly related to it . When organizing “Computer Business” games organized using ICT , the interests of the student and his psychological state are taken into account, in which the participants of the game have the opportunity to be both a participant and an observer at the same time. Business games, created using modern tools, in a broad sense, perform such a task that in various production situations, imitation of quick and effective management decisions occurs. Such games are also important in the development of professional competence.

Cooperative games are a way to implement modern educational projects . game technology is also considered. They essentially increase activity and form life skills. Children, that is, students, can enter into certain characters and experience the emotions inherent in that character.

Such business games, used in accordance with educational goals, prepare students for the future and motivate them to develop properly in their lives. Young people who are in the process of development can achieve the goals they want and dream of. analyzes life situations and makes the best basic work release in process Easy access to free speech is not guaranteed by the person , the knowledgeable expert .

Situational problem solving games construction

1- **Step 1.** The preparation stage for the activity , in which students are given various tasks based on their abilities and interests in the field. It studies the theoretical foundations of problem solving . In advance , the object , game model , game situation , tasks of the players , and the task of the game . order and The rules are explained. Necessary tools, demonstration Tools and demonstration materials are prepared in advance for the lesson .

2- **step** As part of the organizational work, groups of participants are formed in the business game . Leaders for the process t an l a n a d i , i s h t i r o k s r o l l ar The participants were divided into Different methods can be used in selection . Sometimes participants go away request help in the definition of knowledge , positions when assigning or performing a task order It is also possible to work on a project . In the game of business intelligence take a role distribution The

impartiality of the participants based on personality from aspects and the potential will come out . So , it's very difficult personal aspects and some facts known to the roles suitable The next step is to raise the level of play . It takes you to the next level .

3- step The goal of the game is to in increasing participation of all groups one kind downloads with attention to ensuring, second o n the other hand, the tasks distribute and go correctly decisions cup The importance of doing the process accelerates and works in groups this is a joke makes it possible to do.

4- step. Generalization and conclusion exit Also called a step . In the game of skill think of the results The analysis is conducted under the guidance of the manager . The work of the participants is clearly and objectively assessed , the process is analyzed , reflections are made and recommendations are given . At the end of the business game , the teacher The head of the department announces the results.

Based on this technology and business skills games , done other of decisions The main goal is to encourage the systematic development of gifted children, economic and social s a m a r a n g i n g All decisions are emphasized .

In the business intelligence game , the game conditions begin with predicting future activity. Such leaders ' messages t a v a k k a l their work I t p r o v e s its effectiveness in work . It creates a healthy competitive situation , especially when determining the overall score of the group . Work ethic from the game o l i n g a n result prepares children for life.

A purposeful game of business intelligence model and specifications :

- game plan and goal , etc. object and the environment availability ;
- working group representatives and role distribution ;
- the correct distribution of leader students and their participation in decision - making place ;
- Ishtir Okchil Arning friendly and fair relations between the two countries ;
- consensus - based consensus of the goal current situation ;
- a community based on mutual respect to be decisions working to cry ;

- decisions that lead to results variable ;
- emotional during activity hard work proper management ;
- educational, business game workers from the community in a dream evaluation .

- expanding, intellectual and creative games also contribute to the development of creativity in a child. In the game , the sociability of a person , communicative adjectives development and increases intellectual potential . The student 's literacy , thirst for knowledge , maturity , and development in decision - making will encourage qualitative changes in the classroom .

Depending on the nature of specialized schools, they are aimed at in-depth teaching of social and humanitarian, exact and natural sciences. In the teaching of natural and exact sciences, there are “Flip Class”, “Town of Scholars”, “ The Golden-headed Boy”, “Map Without Pictures”, “When Numbers Enter the Language ” , “ Geometric Shapes ” are among these purposeful , didactic game methods . Students ' knowledge is assessed on the basis of scores The competitive lessons organized in various subjects are distributed according to the number of students in the class. Seven or eight two , three groups Scorers are recruited . Scoring indicators and criteria are developed in advance.

It is recommended to implement the "Bilits Questions" method in any lesson to reinforce the developed and covered topic.

"Bilits Questions" method specified type at the end in the group received bullets and bullets yiqq an It is appropriate to provide fair incentives based on score .

Sample: the game questions The following can be formed :

1. In the world the most big Can you tell me the name of the lake? (Caspian (d yen g izi)
2. Karakalpakstan List the 4 districts of the republic . (Nukus , Amu Darya, Beruni, Kungurat)
3. Name 3 Uzbek folk songs . (Andy John) (Police , Tanovur, Dilhiroj)
4. " Magic " "The cap is a " Who is the author ? (X. Tokhtaboyev)
5. T.Malik's " Shaitan a t" what is roman head Name the monster. (As a dbek)

6. Uzbek on the menu best What is the name of a delicious and delicious dish ? (pilaf)

7. "Uzbekistan " Who are the authors of the poem ? (H. Olimjon , A. Oripov).

conclusion , educational games that effectively lead to child development complement the content of the lesson and serve the development of the student. Games to turn work is done games , didactic games, role-playing games, computer earth games and intellectual games that motivate the future. These educational games develop the positive qualities of children as modern heroes.

Conclusion on the second chapter a

Educational games , interactive lessons as a tool develops the creative activity of gifted students. Systematically activates and develops their leadership abilities, management potential. The correct upbringing of a child's abilities is measured by the professional skills of the teacher. A student studying in general education schools is considered the most suitable age for the development of creative activity. These hone the skills of students in mastering new knowledge or independently searching for truths corresponding to science. Especially if a child is engaged in the practice of discovering something on the basis of research, then the heuristic theory and problem-based learning methodology justify themselves. Heuristic education, on the other hand, is aimed at forming creative abilities in students, developing cognitive activity, and organizing scientifically based activities . with that it is related show .

In interactive teaching, students are consistently taught to think logically, scientifically, didactically, and creatively by creating problem situations. This approach is a technological approach to the educational process, which certainly guarantees the expected result and gives its effect.

In teaching , "Perception Map", "Brainstorming " , "Cluster" ja d and li to create , poetry find a job also organized by the " Think , search , to p! » interactive educational game lessons are a vivid example of this . In the systematic development and development of the activity of a talented creative student , purposeful thematic dialogue lessons, discussions, debates, fantasy-adventure, travel, heuristic research lessons, logical thinking lessons such as problem solving, invention, modeling, artistic and technical creativity, creation through symbols and images, discoveries Examples include writing essays and essays, compiling

chronicles and genealogies. Business and educational games ensure the quality of the lesson. They become an active teaching tool in its management. Lessons in this category are practical, process-based lessons that satisfy the interests of students and develop their creative activity. In particular, in management, person-oriented education systematically and step-by-step forms the student's creative activity. It can be seen that, in contrast to traditional forms of teaching, this approach is a technological approach to education, which gives the effect of the targeted use of innovative methods based on interactivity. At the same time, it creates favorable opportunities for the emotional, intellectual and general moral development of the individual through educational games. Educational games are a business-like method that motivates students in a short period of time, sharpens their logical thinking, and leads them to new discoveries by developing and managing students' creative activities through interactive lessons. business games, role - playing games, Didactic games are implemented in the form of computer games.

The interactive lessons that were carried out during the scientific research were, in their essence, intellectual - creative games, business games. also in the style of roll i thoughts to opportunities proved that he has.

CHAPTER III. CONTENT AND EFFECTIVENESS OF EXPERIMENTAL TEST WORKS ON DEVELOPING THE CREATIVITY OF GIFTED STUDENTS

§ 3.1. Experimental stages of developing creativity in gifted children

In the process of analyzing the situation in school practice of the problem of developing students' creative activity in specialized education, the main attention was paid to the factors that create students' creative activity. Based on the opinions of school teachers about creative education in the conducted experimental work, on the example of this object The practice of organizing pilot stages was introduced. The real state of the activity and the strengths and weaknesses of teachers were analyzed.

Experimental work carried out to educate and develop the creativity of gifted students In order to study and generalize existing experience in analyzing students' creative activities in education, and conduct conceptual analysis, the lessons of representatives of the field, namely teachers, were observed, and answers to the following questions were obtained as part of the analysis:

first, questions consistent with the goal of educating creative children - the purpose, objectives, expected results of organizing education based on creative approaches, as well as the relevance of acquiring new knowledge, the compliance of the work performed with the goals and objectives of creative education;

secondly, a set of questions related to the content of education that increases the potential of creative children - the correspondence of creative tasks to the content of the educational material, the correspondence of students to the learning opportunities that direct them to specific, realistic research, the place of one or another creative work in the system of subject tasks;

thirdly, questions related to the characteristics of the activating creative process of education - the correspondence of tasks to the type and stages of the lesson, their relevance to the real learning capabilities of students, their connection with the speed of work, the techniques and methods used in performing independent work, the application of previously learned knowledge and skills in performing creative tasks, mechanisms and resources for implementing new knowledge and creative activity;

Fourth, questions related to the expected result of creative activity - the

relevance and importance of creative work for students, the commonality of the content and purpose of educational tasks and educational material, and the compliance of the expected result with the requirements for mastering the full BKM, the importance of creative and tasks in developing independent activity in students, and the effectiveness of management in this.

experimental work suitable for the effective management of creative education in specialized schools were conducted at the Erkin Vohidov Creative School in Margilan, Fergana Region, the Halima Khudoyberdiyeva Creative School in Syrdarya Region, and the Zangiota Specialized Schools in Tashkent Region.

in specialized schools, the types of lessons developed by Prof. O. Rozikov were taken as a basis ¹¹⁸. The use of the types of lessons selected for the experiment was noted: namely, lessons for teaching and consolidating the subject educational material; interactive repetition of the topics covered and exercises for the formation of practical skills; lessons for assessing the results and generalizing skills; systematic control of the acquired knowledge and skills, resulting lessons

Table 3.1. Distribution of observed lessons on organizing creative work .

Observed lessons amount	Lesson types			
	Teaching a new topic and mustache - reduce	Review and qualification to produce	Knowledge, skills and qualifications generalization	Knowledge, skills and skills control to do
200	57	123	8	12

the tables , the possibilities of organizing creative education in each of the types of lessons are systematically implemented . The first type of lesson is the effective teaching and consolidation of new educational material, the core of the activity prepares creative students for studying a new topic. In the process of work, the focus is on ensuring the understanding and perception of definitions, rules, and reasonable arguments on the topic , and the knowledge and skills

¹¹⁸ . Rozikov O. Types of lessons in the Uzbek language. - Tashkent: Teacher, 1976;

¹¹⁹ That book.

acquired from the acquired and perceived activities strengthen the methods of practical activity. By posing problems in the lesson, posing targeted questions, and creating situational, educational situations, students' attention is focused on the arguments on the new topic, thereby explaining the purpose of teaching the topic. As is known, it is also possible to ensure the effective effectiveness of education by teaching or defining independent goals for students, explaining the solution to this problem, and searching for answers to the questions posed. The second stage of the lesson - the stage of perception of new knowledge and methods of practical activity, students are allowed to engage in creative research. In particular, creative students are directed to compare the previously studied topic and the newly studied topic with reasonable arguments, systematically observe the arguments related to the topic, draw clear conclusions from the observed arguments, as a result, compare the necessary and significant conclusions with the definitions and rules given in the textbook, and carry out the task of performing tasks by analyzing the comparative conclusion. This type of educational practical work ensures the creative independent activity of students. Similarly, when the topic is studied, various creative works can be carried out at the stage of its consolidation. Such practical and creative work includes creative work such as comparing the learned definition and rules with new and reasonable arguments, copying, applying the definition and rules to a new educational situation. It is clear that it is possible to involve students in creative work in all types of lessons. In particular, directing students to scientific research is considered an urgent problem. In the process of research, the study of teachers' experience showed that in 57 lessons of the type of lesson such as teaching and consolidating new educational material, creative work was organized 25 times. An average of 4-5 minutes was allocated for each creative work. The distribution of creative work in the main stages of the lesson is presented in Table 3.2.

Table 3.2. The amount of creative work in lessons on teaching and

reinforcing new educational material .

Write taken lessons amount	Training time (minute count - in)	Main stages of the lesson			Time allocated for creative work (in %)
		New learning to study the material preparation	New learning teaching material	New learning strengthen the material	
57	2565	12	33	30	75
(%) on account of	100	≈2.3	≈6.2	≈5.3	≈13.8

Based on the table, two conclusions can be drawn: – in the first type of lessons, little time is allocated to organizing creative work and it is held occasionally; – in the second type of lessons, that is, in the lesson of repeating the lessons and forming practical skills, practical skills on the topics studied were improved and work was carried out on exercises from the textbook. Lessons of repeating the lessons and forming practical skills are designed to monitor students' memory, and in them a lot of time is allocated to educational practice for the skills of applying knowledge to similar conditions. This situation leads to the fact that very little time is allocated to the implementation of creative tasks in education.

In total, out of 200 lessons observed, creative work was conducted 107 times, with an average time of 5-6 minutes. Almost all of the creative work was in the nature of applying the learned and mastered knowledge to situational situations.

In the observed lessons, learning tasks were not organized. Creative work was distributed in the main stages of the lesson, as shown in Table 3.1.3.

Table 3.3. Distribution of creative work in the main stages of the lesson

Recorded lessons amount	Study time (in minutes)	Main stages of the lesson			Time allocated for creative work
		Recalling knowledge, methods of activity	Knowledge, implementing operating methods	Expanding knowledge and methods of activity	
123	5535	-	515	-	515
%	100	-	≈13	-	≈13

Our observations and analysis show that in the second type of lessons, only 13% of the total budget of time allocated for the repetition of the previous lessons and the formation of skills is allocated to the organization of students' creative work. In this case, it is possible to consider the situation as satisfactory. However, we also consider it appropriate to highlight some weaknesses in the technology of organizing and conducting such creative work: in some cases, the almost complete repetition of the topics covered, the formation of practical skills are disproportionate aspects of the lessons, and the creative work of students is suboptimal or excessive in relation to the stages of the lesson. In the conducted scientific, theoretical and practical methodological research, each stage of the lessons is a targeted step in the educational process, and the practice of carrying out creative tasks for students during the teaching period is considered necessary [157, 62]. In the scientific and pedagogical research of scientists OR Rozikov, NS Saidahmedov, it was emphasized that the amount of creative and non-creative work in the teaching system should be 50% [160; 162].

In the process of education aimed at personal development, the intellectual, creative characteristics of the student are manifested ¹²⁰. Today, the main goal of education is to comprehensively develop the talents and abilities of young people, support their aspirations to master science, realize their talents, further improve the system of continuing education, and increase their opportunities for using quality

¹²⁰ Rakhimov M. Journal of Language and Literature Education. 2024-yT, issue 11.

educational services . The main goal of education is to develop the intellectual and creative potential of young people, create the necessary conditions for supporting and encouraging talented students, and educate them as well-rounded, physically and mentally healthy individuals in the spirit of loyalty to the Motherland.

Specialized and creative schools have established comprehensive educational processes aimed at teaching young students the rich creative heritage of our great ancestors and raising them as worthy successors. Specialized and creative schools in Uzbekistan are working to improve their activities, further support and encourage young talents, and further develop the opportunity to provide them with education and upbringing based on the requirements of the times.

In particular, our research was focused on the education and creativity of gifted students, and in addition to implementing its unique management system, the subjects taught there were also studied and researched.

In specialized and creative schools, in addition to subjects such as native language and literature, foreign language, history, education, computer science and information technologies, physics, astronomy, chemistry, biology, geography and economics, and initial preparation for conscription, targeted training is also planned for students in specialized subjects such as "Literary Theory", "Literary Rules", "Literary Process", "Oratory Art", "Folk Oral Art", "Textual Studies", "Publicistics", "Translation Rules", "Dramaturgy", "Interesting Mathematics". It is planned to organize regular "Master Classes" by famous writers, poets, and writers in creative schools. Accordingly, members of the Writers' Union of Uzbekistan, professors and teachers of prestigious higher educational institutions conduct classes aimed at developing the creative talent of students in creative schools. Students of the Creative School will become future translators, journalists, linguists, scientists, poets, writers, diplomats, and, in short, mature professionals who promote patriotism, regardless of their profession. Practical, master classes are important in developing patriotism and love for the Motherland, tolerance, respect for the laws of the country, national and universal values, etc. Based on the analysis, we have presented the master class curriculum in the appendix.

Through these master classes, these students get to know the creative process firsthand, learn about the history of literature, literary theory, and experience from

famous creators in the field. In addition to reading and analyzing examples of Uzbek and world literature, students also gain the ability to express their creativity. In addition, the effectiveness of master classes in publishing young creators' creative examples in the media and covering social networks is unparalleled. The plan for such master classes is planned for a total of 34 hours, which further increases the competence of creative students in their specialty. A number of stages are also observed in the lessons of generalization of knowledge and skills; comparing evidence on two or more topics; drawing a general conclusion through comparison; applying the conclusion to the given learning situations. In the observed lessons, creative work on comparing evidence, drawing general conclusions, and applying the conclusion to the given learning situations was sometimes partially or not used at all.

Our observations confirm that in the activities of teachers of specialized and creative schools, some ambiguities were observed in the perception of the specific characteristics, goals, and objectives of the lesson type in terms of lesson types.

Based on this, a questionnaire was created about the types of lessons, the specific features, goals, and objectives of each type. 50 teachers with higher education and 50 first-class teachers participated in the questionnaire.

The survey asked 4 questions, which indicated the names of the lesson types: a sample survey for the first lesson type.

1. Your name, surname.
 2. The school you work at.
 3. Your teaching experience.
 4. Answer the questions formulated for the lesson on teaching and reinforcing new learning material.
- to teach and reinforce new learning material :
- B. Indicate the main stages of the lesson type .
- V. Give examples of creative work that will be organized at the main stages of the lesson.

Your own opinion on the creative organization of the lesson .

Such questionnaires are designed for all types of lessons, and a teacher who

fully answers the questions in the questionnaire receives 10 points, and loses 2.5 points for one incorrect answer. Teachers who participated in the questionnaire were divided into 4 groups: Group 1 - teachers with higher education; Group 2 - teachers of the 1st category; Group 3 - teachers with higher education; Group 4 - teachers of the 1st category. Participants in each group answered certain questions. For example, group 1 teachers with higher education answered questions about lesson type 1, group 2 teachers with category 1 answered questions about lesson type 2, group 3 teachers with higher education answered questions about lesson type 3, and group 4 teachers with category 1 answered questions about lesson type 4.

Then the questionnaires were switched: Group 1 answered questionnaire 2, Group 2 answered questionnaire 1, Group 3 answered questionnaire 4, and Group 4 answered questionnaire 3. After the questionnaire questions were switched for the 3rd and 4th time, the participants were considered to have completed all tasks.

In order to compare the answers of the teachers who participated in the pilot tests, the answers of the participants of groups 1 and 3, and groups 2 and 4 were compared. The analysis of the answers of the participants of groups 1 and 3 shows that, despite having higher education, some teachers and even first-class teachers with higher education sometimes have a shallow idea of the types of lessons, their goals and objectives.

Table 3.5. The number of teachers who allocated creative learning tasks in the lesson of teaching and consolidating new educational material

Questionnaire Number of teachers who participated in the survey	Main stages of the lesson			Teachers who noted the need for creative activities at
	Preparing to learn new learning material	Studying the educational material	Reinforce learned knowledge	

				different stages of the lesson
100 people or 100%	3	4	8	15 people or 15%

It turned out that the respondent teachers made a lot of confusion in determining the specific features of each type of lesson, their main stages. Although 15 out of 100 participants correctly distinguished the main stages of the first type of lesson, they made a mistake in determining creative work in connection with the stages of the lesson. It should be noted that the number of teachers who distinguished the main stages of the lesson of teaching and consolidating new educational material and allocated creative educational tasks in them is extremely small. To confirm our opinion, we presented the collected evidence for the first type of lesson in the form of a table.

Of the teachers who participated in the survey, 3 teachers described creative work as part of the preparation for teaching new educational material, 4 teachers described creative work directly in the process of explaining a new topic, and 8 teachers described creative work as part of the consolidation of the studied topic. Thus, 15% of the teachers who participated in the survey described creative work as part of the processes of teaching and consolidation of new educational material. Comparing the evidence from observing teachers' lessons ($\approx 13.8\%$) with the answers to the questionnaire questions (15%) led to a number of conclusions: in pedagogical practice, the organization of students' creative work and teachers' perceptions of creative work are very close to each other: $\approx 13.8\%$ and 15%. This indicates that the processes of organizing creative work in education are gradually taking their place in the activities of teachers; In didactics, as well as among teachers and students of specialized and creative schools, an educational task that begins with students' thinking (thinking) should be completed with work aimed at memory, and, conversely, education that begins with an educational task based on memory should be completed with creative work. This makes it possible to determine the ratio of creative and non-creative work in the form of 50%-50% .

Organizing creative and non-creative work in such a ratio (50%-50%)

increases the effectiveness of education. There are a number of difficulties in raising the systematic activity of teachers of specialized and creative schools to this level, and it is assumed that it will be improved gradually.

§ 3.2 . The results of experimental work and their analysis

the pedagogical direction in improving and managing the activities of specialized and creative schools was on two aspects - the theoretical study of the problem selected for research and the assessment of the effectiveness of the ideas identified during the theoretical study and necessary for their implementation in practice through pilot studies. We conditionally divided the research activities carried out in this direction into the following three stages:

Stage 1 : Substantiation of theoretical ideas (concepts) that provide a solution to the selected problem based on available sources and observation of the pedagogical process (development and recommendation of theoretical ideas).

At stage 2: determining measures to ensure the implementation of the theoretical ideas based on it into practice (identifying management methods, forms, methods, tools and factors).

Stage 3: Analysis of the implementation of priority theoretical ideas into practice and its effectiveness.

The main goal of the study, which was conducted to ensure the effectiveness of the activities of specialized and creative schools, was determined to be the implementation of scientifically based concepts (theoretical ideas) into practice. As mentioned in the first and second chapters of the work, the following concept is of priority importance in ensuring effective management activities after various forms of advanced training courses for self-development and improvement of subject teachers and school leaders: specialized and creative schools, taking into account the necessary needs and modern requirements It is advisable for managers to pay serious attention to the development of a management efficiency program and the creation of an innovation system in an educational institution. In the process of implementing this concept into practice, the following main tasks were successfully solved:

- clarify the image and moral qualities of a modern head of an educational institution;

- improving the principles of managing educational activities, spiritual and educational work, and financial systems in the program to ensure and develop effective management activities;

- training gifted students of educational institutions using research-based methods and technologies;

- working with gifted students in an educational institution develop a long-term plan;

- creating effective management theories for working with gifted students in an educational institution ;

- to substantiate an innovative system of working with gifted students in an educational institution;

- develop a monitoring schedule for the effectiveness of individual activities, including those of gifted students .

In order to positively address these challenges, it is important to ensure consistency, proportionality, communication, and systematicity between education and post-course activities after various types of qualification courses.

In particular, one of the urgent tasks of education is to determine the pedagogical conditions for educating a creative student by enriching the consciousness, feelings, raising their spirituality, and developing their worldview, as well as to develop recommendations on indicators of effectiveness, which requires the study of global educational problems based on drawing appropriate conclusions from the existing achievements and shortcomings in the field and systematically designing its prospects. The research work aimed at this goal was carried out in three stages as follows.

the first stage (2020-2021), the pedagogical and ethical foundations of educating young people in the spirit of creativity in the educational system of specialized and creative schools and the study of related historical, philosophical and pedagogical literature, the selection and selection of objects for pedagogical experimental work, and the planning of pedagogical research criteria.

Two classes from each of the Erkin Vohidov Creative School, Halima Khudoyberdiyeva Creative School, and Zangiota Specialized School in Tashkent

Region were selected for the pilot study: grades 7- “A”, “B”, 8- “A”, “B”, 9- “A”, “B”.

The second phase, scheduled for 2021-2022, Experimental work was conducted on the research topic. Criteria and forms of educating gifted students were identified and recommendations were developed for developing students' creativity, systematic assessment of various situations and quick decision-making, proving independent opinions orally and through evidence, studying historical, literary and artistic sources related to the work and life of poets and writers (see Table 3.3).

the third stage , scheduled for 2022-2023, were organized and summarized.

During the pilot phase, 432 students participated in the processes.

Table 3.6 . **At the beginning of the experiment, students' mastery indicators were used** to determine the level of effectiveness of their knowledge of creative and creative activities and national education.

Zangiota Specialized School, Tashkent Region		7	8	8	7	7	1	9	0	1
Total	5	6	8	8	4	0	9	2	16	16

Above Based on the results of the table, students That is ¹²¹based on the results of the experiment to determine the effectiveness of the respondents' knowledge of creativity and national education, we analyzed the average mastery in the experimental and control classes using the Student and Pearson χ^2 mathematical and statistical method. A total of 432 students participated in the experiment, of which 216 participated in the experimental class and 216 in the control class .

The brief essence of the problem is as follows: let two sets of data be given. One is the average scores of the students in the experimental class , and the other is the average scores of the students in the control class . The scores are assumed to have a normal distribution. This assumption is reasonable because the conditions for approaching a normal distribution are simple and they are met.

₁ indicating the cognitive efficiency of students and a hypothesis N_0 contradicting it are selected.

Results of the mastery of students' knowledge of creative activity and national education at the beginning of the experiment to determine the level of

¹²¹ See: O. Rozikov and others. Educational technology. –T.: Teacher, 1999, pp. 48-50; M. Makhmudov. Theoretical foundations of didactic design of education. Abstract of the dissertation written for the degree of Doctor of Pedagogical Sciences. –T.: 2004, pp. 18-19;

Classes	Number of students	Mastery levels			
		High	Good	Medium	Low
Experience class	216	51	52	63	50
Control class	216	50	47	60	59

the mastery indicators and the number of students in the experimental class as X_{in} and the same in the control class as Y_{jm} , we obtain the following statistically grouped variation series, also defining a high indicator as 4 points, a good indicator as 3 points, an average indicator as 2 points, and a low indicator as 1 point.

Mastery indicators in the experimental class:

$$X_i: 4; 3; 2; 1; n_i: 51; 52; 63; 50; n = \sum_{i=1}^4 n_i = 216$$

Mastery indicators in the control class:

$$Y_j: 4; 3; 2; 1; m_j: 50; 47; 60; 59; m = \sum_{j=1}^4 m_j = 216$$

The diagram corresponding to these choices looks like this:

Figure 3.1. Acquisition indicators at the beginning of the experiment

Figure 3.1. Students' creative activity at the beginning of the experiment

To facilitate statistical analysis, we calculate the frequencies (frequencies) n_i and $p_i = \frac{n_i}{n}$

and n_j from the above variation series based on the appropriate statistical probability formulas and $q_j = \frac{m_j}{m}$ (1).

$$X_i: 4; 3; 2; 1; n_i: 0,24; 0,24; 0,29; 0,23; i=1;4; p_i=1$$

$$Y_j: 4; 3; 2; 1; m_j: 0,23; 0,22; 0,28; 0,27; j=1;4; q_j=1$$

We begin the statistical analysis by calculating and comparing the average learning outcomes for both classes. The average learning outcomes yielded the following results:

$$X = \sum_{i=1}^4 n_i p_i = 0,24 \cdot 4 + 0,24 \cdot 3 + 0,29 \cdot 2 + 0,23 \cdot 1 = 0,96 + 0,72 + 0,58 + 0,23 = 2,49$$

$$\text{In percent } x \% = 2,494 \cdot 100\% = 62,25\%$$

$$Y = \sum_{j=1}^4 m_j q_j = 0,23 \cdot 4 + 0,22 \cdot 3 + 0,28 \cdot 2 + 0,27 \cdot 1 = 0,92 + 0,66 + 0,56 + 0,27 = 2,23$$

$$\text{In percent } y \% = 2,414 \cdot 100\% = 60,25\%$$

So, at the beginning of the experiment, the students in the experimental class and the students in the control class were $(62.25 - 60.25)$ higher by $\% = 2$. % This, in turn, $62.25\% - 60.25\% = 1.03$ means that there is an equal excess. These indicators indicate that these indicators are too low to achieve efficiency.

Now, at the end of the experiment, we will consider the results of the mastery in order to determine the pedagogical conditions for educating students, determine their creative approach capabilities, and determine the level of effectiveness of their knowledge of the subject's mastery competencies, as one of the urgent tasks of education .

Results of the study to determine the level of effectiveness of students' knowledge of creative activity and national education at the end of the experiment

Classes	Number of students	Self- care degrees			
		High	Good	Medium	Low
Experience class	216	89	54	58	15
Control class	216	52	50	58	56

We will introduce the same definitions as above, based on the mastery indicators and the number of students at the end of the experiment.

Mastery indicators in the experimental class:

$$\sum_{i=1}^4 x_i \cdot 3; 2; 1; \text{ and } 89; 54; 58; 15; n = \sum_{i=1}^4 n_i = 216 \quad (2)$$

Mastery indicators in the control class:

$$\sum_{j=1}^4 y_j \cdot 3; 2; 1; \text{ and } 52; 50; 58; 56; m = \sum_{j=1}^4 m_j = 216 \quad (3)$$

The diagram corresponding to these choices looks like this:

Figure 3.2. Acquisition indicators at the end of the experiment.

Figure 3.2. Students' creative activity at the end of the experiment

To facilitate statistical analysis, we calculate based on formula (1).

$$\sum_{i=1}^4 x_i \cdot 3; 2; 1; \text{ and } 0.41; 0.25; 0.27; 0.07; i = 1 \text{ to } 4; P_i = 1$$

$$\sum_{j=1}^4 y_j \cdot 3; 2; 1; \text{ and } 0.24; 0.23; 0.27; 0.26; j = 1 \text{ to } 4; q_j = 1$$

We begin the statistical analysis by calculating and comparing the average learning outcomes for both classes. The average learning outcomes yielded the following results:

$$\bar{X} = \frac{1}{n} \sum_{i=1}^n P_i X_i = \frac{0,41 \cdot 4 + 0,25 \cdot 3 + 0,27 \cdot 2 + 0,07 \cdot 1}{4} = \frac{1,64 + 0,75 + 0,54 + 0,07}{4} = 0,75$$

$$\text{In percent } \bar{X} \% = 0,75 \cdot 100\% = 75\%$$

$$\bar{Y} = \frac{1}{n} \sum_{j=1}^n Q_j Y_j = \frac{0,24 \cdot 4 + 0,23 \cdot 3 + 0,27 \cdot 2 + 0,26 \cdot 1}{4} = \frac{0,96 + 0,69 + 0,54 + 0,26}{4} = 0,6125$$

$$\text{In percent } \bar{Y} \% = \frac{0,6125}{1} \cdot 100\% = 61,25\%$$

So, at the end of the experiment, the gifted students in the experimental class and the control class had a score of $(75 - 61.25)$ higher by $\% = 13.75\%$. This, in turn, $75 - 61.25 = 13.75$ means an equal excess. These indicators indicate that the experiment was effective.

In order to identify possible errors in the process of determining mastery, we first determine the mean square and standard errors.

$$S_x^2 = \frac{1}{n} \sum_{i=1}^n P_i X_i^2 - (\bar{X})^2 = \frac{0,41 \cdot 4^2 + 0,25 \cdot 3^2 + 0,27 \cdot 2^2 + 0,07 \cdot 1^2}{4} - 0,75^2 = \frac{0,41 \cdot 16 + 0,25 \cdot 9 + 0,27 \cdot 4 + 0,07 \cdot 1}{4} - 0,5625 = \frac{6,56 + 2,25 + 1,08 + 0,07}{4} - 0,5625 = \frac{9,96}{4} - 0,5625 = 2,49 - 0,5625 = 1,9275$$

$$S_y^2 = \frac{1}{n} \sum_{j=1}^n Q_j Y_j^2 - (\bar{Y})^2 = \frac{0,24 \cdot 4^2 + 0,23 \cdot 3^2 + 0,27 \cdot 2^2 + 0,26 \cdot 1^2}{4} - 0,6125^2 = \frac{0,24 \cdot 16 + 0,23 \cdot 9 + 0,27 \cdot 4 + 0,26 \cdot 1}{4} - 0,37515625 = \frac{3,84 + 2,07 + 1,08 + 0,26}{4} - 0,37515625 = \frac{7,25}{4} - 0,37515625 = 1,8125 - 0,37515625 = 1,43734375$$

The standard errors in the control and experimental classes are:

$$S_x = \sqrt{1,9275} = 1,3883. S_y = \sqrt{1,43734375} = 1,1989.$$

Therefore, the standard error in the experimental class was smaller than the control class, i.e. $1,3883 > 1,1989$. To show this more clearly, we calculate the mean values for both statistical samples using the coefficients of variation, i.e. C_x and C_y , using the formula:

$$C_x = \frac{S_x}{\bar{X}} \cdot 100\% = \frac{1,3883}{0,75} \cdot 100\% = 185,11\% \approx 185\%$$

$$C_y = \frac{S_y}{\bar{Y}} \cdot 100\% = \frac{1,1989}{0,6125} \cdot 100\% = 195,74\% \approx 196\%$$

Therefore, the average accuracy of the mastery index in the experimental class differs by one unit from that in the control class.

Now, given the similarity of the two sets of unknown means, we test the null hypothesis based on Student's t-test:

$$H_0 : \mu = \mu_y$$

Based on this, we perform the following calculation:

$$T_{x,y} = \frac{x - y}{\sqrt{S_x^2/n + S_y^2/m}} = \frac{3 - 2,450,96216}{\sqrt{1,2475216}} = \frac{0,550,0044}{\sqrt{0,0058}} = \frac{0,550,0102}{\sqrt{0,0058}} = 5,45$$

We calculate the degrees of freedom based on the Student's t-test using the following formula:

$$K_{x,y} = \frac{S_x^2/n + S_y^2/m}{\frac{S_x^2/n}{n-1} + \frac{S_y^2/m}{m-1}} = \frac{0,96216 + 1,2475216}{\frac{0,96216}{20} + \frac{1,2475216}{215}} = \frac{(0,0044 + 0,0058) \cdot 2}{\frac{0,0044}{20} + \frac{0,0058}{215}} = \frac{(0,0102) \cdot 2}{\frac{0,000019215}{20} + \frac{0,000034215}{215}} = \frac{0,00010,00000009 + 0,00000016}{0,00010,00000025} = 400$$

the significance level of the statistical sign for this probability $\alpha = 0.05$, then $r = 1 - \alpha = 0.95$ and the degrees of freedom are $k = 400$. The critical point of the two-sided criterion from the Student function distribution table is:

$$t_{1-(1-p)/2}(k) = t_{1-(1-0,95)/2}(400) = t_{0,975}(400) = 1,96$$

It is clear from this that statistics selection value from the critical point It is large . From this, Student's selection criterion is:

$$T \text{ is equal to } x_{y} = 5.45 > 1.96.$$

about the equality of the mean values is rejected. It can be said with 95% confidence that the average mastery indicators in the experimental classes were always higher than the average mastery indicators in the control classes.

Now we see a case where the teaching styles in the experimental and control classes were different, which contradicts our hypothesis.

$$K_0 : F_x = F_u$$

In this case, the distributions of the two prime set distributions coincide.

N_1 : - is normally distributed at a given level of significance α , we first calculate the theoretical frequencies and then the Pearson goodness-of-fit criterion - Chi-square, based on systems (2) and (3) according to the following formula:

$$X_{n,m}^2 = \sum_{i,j=1}^n \frac{(n_{ij} - m_{ij})^2}{m_{ij}} = \sum_{i,j=1}^n \frac{(m_{ij} - n_{ij})^2}{m_{ij}} .$$

Based on the formula $X_{n,m}^2$:

$$X_{n,m}^2 = \frac{(89-52)^2}{52} + \frac{(54-50)^2}{50} + \frac{(58-58)^2}{58} + \frac{(15-56)^2}{56} = 1369141 + 16104 + 0116 + 168171 = 9,7 + 0,15 + 0 + 23,68 = 33,53$$

is equal to

The degrees of freedom for this criterion are $v = 4 - 1 = 3$, we find the critical point according to the table of the Chi-square distribution. The confidence probability for $r = 0.95$

$$t_{0.95}(V) = t_{0.95}(2) = 7.8.$$

Since the one-sided test rejects the null hypothesis more “strongly” than the two-sided test, we construct a right-sided critical region. The right-sided critical region is equal to:

$$X_{n,m}^2 = 33.53 > 7.8 = t_{0.95}$$

From this, the null hypothesis was rejected because the Chi-square distribution was greater than the critical point.

Now we find the confidence interval to determine the performance indicator of the assessment:

$$\Delta x = t_y \cdot S_{xn} = 1,96 \cdot 0,98216 = 1,96 \cdot 0,9814,7 = 1,920814,7 \approx 0,13$$

$$\Delta y = t_y \cdot S_{yn} = 1,96 \cdot 1,12216 = 1,96 \cdot 1,1214,7 = 2,195214,7 \approx 0,15$$

is equal to . If we find the confidence interval from the results obtained:

$$\bar{X} - t_{kp} \cdot \frac{S_x}{\sqrt{n}} \leq a_x \leq \bar{X} + t_{kp} \cdot \frac{S_x}{\sqrt{n}}$$

For the experiment class:

$$3 - 0,13 \leq a_x \leq 3 + 0,13 \quad 2,87 \leq a_x \leq 3,13$$

For the control class:

$$\bar{Y} - t_{kp} \cdot \frac{S_y}{\sqrt{n}} \leq a_y \leq \bar{Y} + t_{kp} \cdot \frac{S_y}{\sqrt{n}}$$

$$2,45 - 0,15 \leq a_y \leq 2,45 + 0,15 \quad 2,3 \leq a_y \leq 2,6$$

Let's describe the situation in the control and experimental classes

geometrically:

From this, with a significance level of $\alpha = 0.05$, it can be said that the average score in the experimental class is higher than the average score in the control class

and the intermediate intervals do not overlap. Therefore, based on the mathematical and statistical analysis, it was found that a good result was achieved. 16

Based on the above results, we calculate the quality indicators of experimental work.

It is known that $\bar{X}=3$; $\bar{Y}=2.45$; $\Delta x = 0,13$; $\Delta y = 0,15$ is equal to ;

From this, quality indicators:

$$K_{yc6} = (X - \Delta x)(Y + \Delta y) = 3 - 0,13 \cdot 2,45 + 0,15 = 2,872,6 = 1,1 > 1;$$

$$K_{6д6} = (X - \Delta x) - (Y - \Delta y) = (3 - 0,13) - (2,45 - 0,15) = 2,87 - 2,3 = 0,57 > 0;$$

From the results obtained, it can be seen that the criterion for evaluating the effectiveness of teaching is greater than one and the criterion for evaluating the level of knowledge is greater than zero. It is clear from this that the mastery at the end of the experiment is higher than the mastery at the beginning of the experiment. 27

Therefore, based on the above data, it was found from statistical analysis that the experimental work conducted to determine the effectiveness of students' creative approaches in lessons and their knowledge of national education in learning science was effective.

The results at the end of the experiment were also compared overall, and are presented in Table 3.10.

3. 10. Evaluation results in pilot studies

	1st choice: (experimental group)					Choice 2: (control group)				
	Xi	2	3	4	5	Yj	2	3	4	5
Experience – the period before testing	n=216	50	63	52	51	mj=216	59	60	47	50
Experience – the post-test period	n=216	15	58	54	89	mj=216	56	58	50	52

The experimental results obtained are presented in Table 2.

3.11 - Statistical analysis of the results of the final experimental tests in science

Groups / criteria	Experiment group (NT=385)	Control group (NH=382)
Arithmetic mean of grades	XT* =3	Xn*=2.45
Efficiency coefficient	$\eta=1.22$	

Selective dispersion	0.96	1.25
Standard errors of the mean	st=0.98	sh=1.12
Confidence intervals of X*	$2.87 < a_x < 3.13$	$2.3 < a_y < 2.6$
Variation indicators	22.43%	27.12%
Student statistics	T=5.45	
Statistical degrees of freedom	K=400	
Criterion Summary	T=5.45 > 1.96, H1 is accepted	

Conclusions on the third chapter

of the dissertation , entitled " **Experimental stages of developing the creativity of gifted children,** " sets the task of organizing and conducting experimental work to evaluate the pedagogical system in the models, projects, and mechanisms developed in the research work, and to conduct a mathematical and statistical analysis of the results obtained.

This chapter describes the content and analysis of improving the effectiveness of educational institutions based on new approaches to improving the effective management of quality education in specialized schools. For the pilot study, 2 classes from each of the Erkin Vohidov Creative School, Halima Khudoyberdiyeva Creative School, and Zangiota Specialized Schools in Tashkent Region were selected: 7th - "A", "B", 8th - "A", "B", 9th - "A", "B". A total of 432 students were selected to participate.

Pilot work was conducted on the basis of these educational institutions, and was carried out in the following stages: foundational (2020-2021 academic year), formative (2021-2022 academic year), generalizing (2022-2023 academic year). 432 students were involved in the pilot work.

In Uzbekistan, mechanisms have been developed to analyze educational institutions based on new approaches to the effective management of quality education in specialized schools and to develop the content and essence of improving teaching efficiency based on today's requirements.

Based on the analysis of trials and experiences, modules were implemented to properly guide students to become creative, goal-oriented, active, leading, and new-generation professionals who can choose modern professions in the labor market.

Taking into account the creativity of students, along with the implementation of quality education and effective lessons, students of grades VII-IX of specialized and creative schools were identified as the object of research. With the help of qualitative development of the results of the entrance and final controls, the distribution of students' mastery indicators in certain subject areas according to the level of development was carried out at the beginning and end of each sub-stage of the experimental test.

Also, the results at the end of the experiment were presented as effective criteria for the effective management of quality education in specialized schools in Uzbekistan during the research period, as well as the content and analysis of improving educational effectiveness, lesson plans and interesting educational game exercises, and scenarios for special events prepared for their practical application. Namely:

I. Effectiveness of lesson activities:

- 1) organization of lessons in accordance with didactic requirements;
- 2) providing respondents with relevant, necessary information;
- 3) the emergence of interest in the didactic process among the participants of the lesson;
- 4) increased activity among respondents, a creative approach was established;
- 5) Participants' satisfaction with the training session.

In Uzbekistan, the content and analysis of quality creative schools in specialized schools provide a guaranteed result in improving the effectiveness of education in educational institutions based on new approaches. The effectiveness of training aimed at ensuring quality education was analyzed not only in terms of the circumstances that arose during the training, but also in terms of the behavior of respondents in extracurricular conditions, their personal approach, creativity, support for innovative ideas, and the ability to achieve interaction with the pedagogical community. Here, the main criterion was the leadership skills of the respondents, their ability to improve problem-solving skills.

II. Effectiveness of training sessions and creative activities:

- 1) participation in events is voluntary, with no obligation of any kind;

2) the organization of events took into account the wishes, interests, and needs of respondents;

3) the creation of conditions for the free and independent movement of respondents during the events;

4) the events were organized in an interesting and upbeat spirit;

5) respondents' high impressions of the event and their satisfaction with it.

In the emphatic experimental stage, the main focus was on studying the dynamic growth of the development of leadership skills in ensuring the effectiveness of management activities among respondents after the implementation of the methodology by reorganizing the questionnaires conducted during the foundational experimental stage. This was done on the basis of a comparison of the results of the foundational and emphatic experiments. At the end of the stage, the results of all three stages of the experimental work were summarized and their effectiveness was assessed.

CONCLUSION

technology for developing the creativity of gifted children in Uzbekistan allowed us to formulate the following conclusions:

1. Scientific and pedagogical experience has confirmed the importance of correctly solving scientific, theoretical, organizational and methodological work in finding a solution to the problem, while ensuring the analytical quality of the content and the modernized result of improving the effectiveness of education in specialized schools and creative schools based on new approaches.

2. In the conditions of the new Uzbekistan, specialized and creative schools consider it important to use, improve, and develop models and special technologies that illuminate the general essence of the activity aimed at ensuring management based on national values, in accordance with the national education strategy, in order to increase the efficiency of educational institutions based on modern approaches to their activities, and to ensure a guaranteed result. The problem selected for research is considered to be practically necessary for solving it.

3. As a result of the organization of experimental work, it became clear that the ideas leading to efficiency are well-founded, consistent with the practice of specialized schools, and that internal and external influences play a role in the effectiveness of the selected models and methods.

4. Comparison of the results of the foundational and confirmatory experiments conducted in specialized schools, as well as reanalysis of the final results using mathematical and statistical methods, confirmed the successful organization of pilot work on ensuring the effectiveness of management in the activities of students and teachers of specialized educational schools.

, understand the importance of creative development based on personally oriented educational content at the stages of continuous education and express the essence of the task assigned to them.

6. This requirement is met by developing a well-founded mechanism cycle program for students and teachers of specialized schools and their development factors. The high level of such a personal development program from an ideological point of view and its practical relevance depend on the spiritual and moral qualities, worldview, creativity, leadership abilities, skills, as well as experience.

7. Theoretical analysis, although in the conditions of new Uzbekistan, confirmed that the ideas put forward in a number of scientific studies carried out in the country in the relevant direction practically serve as a theoretical basis for the successful organization of management over the collective and production process. In conclusion, a practical study of the current situation revealed that certain tasks need to be solved to ensure the effectiveness of the activities of specialized schools.

9. Direct observation of practice has shown that it is advisable to use certain ways and methods, targeted techniques and methodological forms to ensure the effectiveness of the activities of specialized educational institutions in Uzbekistan.

10. Experimental studies have also confirmed that comparative, special (assessment through expert examination), periodic and chronological (long-term monitoring) studies of the priority aspects inherent in the activities of gifted students in specialized schools and creative schools based on an individual approach, as well as analysis of the approach of the pedagogical team, are the most effective ways in this regard.

11. In order to ensure the effectiveness of the development and management of the activities of gifted students in specialized and creative schools in Uzbekistan, an “Innovative Model of Pedagogical Education” was developed and put into practice based on their individual approaches. The “Talented Creative Laboratory” was established, which proved to be an important factor in assessing the activities of a student, teacher, and creative product. In practice, the methods of self-observation, self-awareness, and self-analysis in such self-assessment are effective and give positive results.

12. Scientific and pedagogical experience has confirmed the importance of properly addressing organizational and methodological issues in finding a solution to the problem of ensuring and improving the effectiveness of the activities of gifted students in specialized and creative schools in Uzbekistan.

Recommendations on management technology for developing the
creativity of gifted children in Uzbekistan :

"ILM-NAJOT" on social networks and websites, which will ensure the effectiveness of systematic education on the activities of gifted students in specialized schools and creative schools, and launch a special site specific to individual creative approaches, which will allow you to consistently inform about the activities and experiences of international and local children achieving creative success through this portal.

2. Development of an electronic database of the most interesting lesson plans created by talented students and teachers in specialized schools and creative schools in Uzbekistan.

3. Widely disseminate the results of specialized and creative schools in Uzbekistan, which guarantee the quality of education, and in general, popularize international experiences in the activities of talented students by the heads of all educational institutions, expanding the opportunity to learn on the spot through internships.

4. Creating a scientific school of "Smart Robots" and "Teacher-Student" through the targeted use and implementation of the knowledge of gifted students. It is necessary to develop and improve the educational-practical, theoretical-methodological provision of gifted students at the level of modern requirements, and to work on new scientific projects by organizing a creative laboratory system.

APPENDIX

Recommendations for teachers on studying the life and creative work of Abdulla Qahhor in grades 7-9 of specialized and creative schools based on new pedagogical technologies:

In the current program, two hours are allocated for studying the work of Abdulla Qahhor in grade 6, and two hours in grade 7. How to conduct the lesson depends on each teacher's own method and style. The textbook provides information about the life and work of the creator, based on the age of the student. The teacher can optionally organize and conduct the lesson using additional literature, pictures and other various visual aids. This lesson is called "Lecture-seminar". The teacher focuses on theoretical activities in order to provide new knowledge. In the introduction to the new topic, the teacher begins the lesson with the following poem about the writer:

The years would be left behind us,
The deserts remained endless, unique.
Why are they infinite, I asked, they said:
Abdullah Qahhor passed through here.
The years would be left behind us,
The peaks remained high and in a row.
When I asked why they were high, they said:
Abdullah Qahhor passed through here too!

Students' understanding is explored with questions such as what do you know about Abdulla Qahhor, have you heard of him? On the table next to the desk, you can place Abdulla Qahhor's works, a booklet based on his work, books written about the author, and various photographs of the writer. Introducing them to the students one by one and creating an imagination shows the uniqueness of the creative approach. In particular, when conveying information about the writer's education to the student, you can focus on the writer's time in the city of Kokand and its surrounding villages. Abdulla's father, Abdukahhor, was from the village of Asht in Tajikistan, and at the beginning of the century he moved to the city of Kokand following his older brother, master Abdurakhman. His father was a blacksmith by profession. Abdukahhor must have been in the desire to raise an independent family, so he left the city and moved

from village to village for several years. His mother, Rohatoy Abdulla, had abandoned her eight children, whom she had given birth to before and after, to the black earth, and had raised this son with care, not trusting the earth and the sky, not letting him take a step away from her. However, this only child of the family opened his eyes, recognized his true nature, and saw the boundless humiliation and cruelty of life. Especially the wandering, nomadic life, humiliation and regrets weighed heavily on the child's heart. "When I joined the students in one village and made friends, I would move to another village and become a 'nomad's student' again. These words were said as a harsh insult," the writer recalls in his autobiography. "One evening, when the neighborhood students were huddled around me like sparrows at the sight of a snake, an old man who was watching took pity on me and said, 'Leave me alone, students, don't touch me. If it's a stranger, it must have been God's doing.'"

This remark of the old man hit me harder than the scolding of the students, and it remained in my heart for many years. I don't know how I used to do it, but in my opinion, this remark silenced me. At home, they would call me "silent" and "a fool in my heart." Such scolding and insulting remarks would make me even "dumb". In this dark torment, the soul now avoids people, even its own mother, as much as possible, in order to escape the scolding of "silent". And not only these. The heartbreaks that occur in the family due to poverty, the helpless living conditions that a student cannot endure, the harsh, merciless relations between people, the ignorance that has spread in the country, its funny and terrible consequences at every step, one sad, tragic adventure after another - Abdullah was born into such an environment and circumstances. In "Tales from the Past", the writer very vividly and touchingly revealed the essence of those school years in a single sentence: "The days began with misery and ended with misery." The impressions of this lonely and sad life, full of misery, turn into a kind of sad song in the heart of the melancholic Abdullah for the first time, or rather, the longings in his heart burst out as a song. The writer admits that his first poem, "creation," was about these sad experiences. So, this cruel life played an important role in Abdullah's development as a writer. Later, when he took up the pen, he often turned to his school memories, and his works about the past were filled with reproaches and sorrows. His father had a great influence on the formation of his creative character. Despite his short arm and a life of hardship, Usta

Abdukahhor was a proud, sharp-sighted, literate, enterprising man who held human dignity high. "My father raised me without taking a single nut from anyone's hand," the writer writes with satisfaction. It was his father who gave Abdullah his first education, and it was his father who instilled in him a love of books. The writer recalls that his father was extremely fond of books and almost every day after work he read interesting books to the family - various war stories, works such as "Dalli and Mukhtar", "Bahori Donish", "Bobo Ravshan". The educational exercises recommended in the scientific work are given in the appendix to the dissertation.

For a certain period, Abdullah studied at an old-style school, learned to read and write, then continued his studies at the new-style school (usuli jadidiya) of an open-minded person named Muhammadjon Qori in Aqqurgan, memorized the "Holy Quran" up to the "Taborak" surah. He studied from the textbooks of Jadid enlighteners. He became acquainted with the literature of Behbudiy, Abdullah Avloniy, Tavallo, So'fizoda, and Sidqiy. That Jadid teacher, Muhammadjon Qori, left a deep mark on the writer's personal life, the writer had a warm relationship with him for a lifetime, and dedicated the most enlightening chapter of "Tales from the Past" to this person. Meanwhile, revolutionary upheavals began in the country. The family's nomadic and wandering life came to an end. Abdullah first studied at the Soviet school "Istiqbol", then at a boarding school, and then at the "Commune School"; Finally, he continued his studies at the educational institution. In 1925, he was invited to work for the newspaper "Kizil Uzbekiston" in Tashkent. He participated in the press under the pseudonyms "Norin Shilpik", "Mavlon Kufur", "Gulyor", "Erkaboy". The desire for knowledge led him to the workers' faculty of the Central Asian State University. Here he studied Russian, began to get acquainted with the world of literature, especially the works of Gogol, Turgenev, Chekhov fascinated him; the works of the great Russian realists led the young Qahhor "to a new world, not a book, but a world of literature where the voice of living people is heard, their faces are clearly visible, and their inner world is reflected like a mirror." The young writer tried to follow them and write works. The novel "Sarob", which he completed in 1934, truly introduced him to the people - the public as a talented writer. The novel was awarded a prize at the republican competition. Then he gained fame as a famous short story writer. His works, which were considered to be among the best examples

of world short story literature, such as "Pomegranate", "Thief", "Patient", "Teacher of Literature", "Artist", appeared on the scene. The writer, who had been working in the short story genre, again touched upon a larger genre. As in "Mirage", he tries to describe the experiences of a person who stands outside the flow of life - here he is no longer an intellectual, but a peasant. The work, which began to be written in the late 30s, was published in 1947. This novel, called "Koshchinor", was seriously criticized for not conforming to the literary standards of that time; the author was forced to rework the work. The novel, which was published under the title "The Lights of the Peacock", although it received positive criticism, is not a book of my taste. "I could not achieve my goal for reasons beyond my control," says the writer. A. Kahhor's life and creative work for more than ten years after Stalin's death were extremely productive and fruitful. Due to the cult of personality, criticism of his authoritarian policies, and the partial introduction of democracy in the country, Abdulla Kahhor began to feel free. He speaks about the helpless situation of the Uzbek people, especially the cotton farmers who made up the majority of the nation, about people suffering in the cotton fields, women being maimed, and students growing up as scoundrels. "Even the legendary Rustam does not have the strength to pick several tons of cotton at a time during the season, to carry such a load on his neck and travel hundreds of kilometers," says the writer, who regrets that this work is being done by an Uzbek woman in the village. Talking about the unpleasant consequences of the Russification policy - "in many families, students do not know their native language at all," which "does not worry parents in the slightest," "in some families, it is a disgrace for a student to speak their native language," which is called "internationalism" - was not a joke in the 60s. Their zeal for the purity of the people, nation, national literature, and mother tongue, their opposition to falsification in literature, and their non-sparing attitude towards even the highest-ranking individuals who aspire to be writers in this regard was truly a great act of courage. His speech at the conference dedicated to the 70th anniversary of the birth of Abdulla Qodiriy, his bitter irony about how great figures like Qodiriy "do not stray far from the iron stake that the Soviet era has driven into them," and his speech at the celebration of his sixtieth birthday - these were tantamount to surrendering to the dragon's will. Abdulla Qahhor dared to do this. Abdulla Qahhor also showed

exemplary activity in artistic creativity during these years. In 1956, the stories "Ming bir jon" and "To'yda aza" were published, and then one after another "Dahshat", "Mahalla", and "Nurli cho'qqilar" were published. These brought a special spirit, a new wave to the development of our national storytelling. The writer's story "Sinchalak", completed in 1958, gained great popularity. In 1962, the satirical comedy "Sound from the Coffin" was published, and in 1965, the autobiographical work "Tales from the Past" was published. At a time when the writer was pursuing great goals and continuing his creative work with great enthusiasm, he fell ill with a serious illness - tuberculosis, and then heart disease joined him. Abdulla Qahhor died on May 25, 1968, in a hospital in Moscow. The story "Love" and the unfinished work "Earthquake" were published posthumously. The writer, who became famous for his many brave deeds throughout his life, bravely met death at the end of his life. Those who witnessed the writer's last days remember this with admiration. For example, the Russian writer K. Simonov wrote: "Qahhor was a brave and courageous man in general. My last memory of him is connected with this aspect of Qahhor's personality. I saw him in the hospital just the day before his death. He did not want to die, even though he knew that death was approaching, and, according to his unique nature, he remained steadfast even in the face of death. He lay on the bed, leaning against the pillows stacked on top of each other, breathing heavily, and his radiant face, which knew no fear, had an expression on it, as if he were a little embarrassed that he had not been able to run to the front of his friends.

Even though Qahhor knew that he was leaving the world, as long as he lived, he felt like a true child of Mother Earth. This was my last meeting with Qahhor. I was amazed by the firm handshakes and deep gazes of a man who was dying. Qahhor was a true human being. "This is how Abdulla Qahhor, a great writer of the 20th century, lived his life. "Abdulla Qahhor is a rare writer who has a good fortune - he has long been in the hearts of the people. It can be said that there is no village in our republic that has not heard his name, no house where his books have not entered. His works are read with equal love by students, farmers, workers - and scientists," Ozod Sharafutdinov. "The writer is so fond of words that if each of these miniature masterpieces were retold, it would take up much of the story itself... " Odil Yakubov. "For the sake of experiment, I removed some words from the teacher's stories

“Patient”, “Thief”, “Pomegranate”. It didn't work. The story fell apart like a porch with one of its pillars removed.” Said Ahmad. Abdullah Qahhor, as the writers you listened to above said, was a great writer who had a unique gift for choosing words and using them. In order to conduct a seminar on the topic discussed, quick questions will be asked based on the “Knowledgeable Question” method:

- When and where was Abdullah Qahhar born?
- What was his family situation like?
- Where did the writer study?
- Where did the writer study?
- In what year did the writer begin his work?
- When was the novel "Mirage" written?
- What other works of the writer do you know?

Students' opinions are listened to, supplemented, and evaluated in the form of quick answers that are clear and factual.

Studying the story "The Patient" based on the heuristic method.

“heurisco,” which means “to seek, to find,” and it involves organizing a productive creative thinking process. When using the heuristic method, the teacher can use the conversation method. Only then is it supplemented with additional questions. The conversation system based on this basis provides directions for completing the task, observing the process, answering questions, obtaining information, drawing conclusions, and comparing conclusions. This method, used in the educational process, forms the skills of students in independent thinking and discussion, and drawing conclusions in acquiring knowledge. Abdulla Qahhor is a storyteller and writer who made a worthy contribution to Uzbek storytelling. He has several stories that tell about past events, one of which is the story “Patient.” The story was written in 1936 and is autobiographical in nature. This story can also be heard in audio form.

The story is listened to by the students.

To reinforce, words that are initially difficult to understand are written on the board and explained:

Izvosh - a horse-drawn cart;

The White Tsar is the Tsar of Russia at that time;

Handle – handle, handle;

Sunlight – spring sunshine with little effect;

Chilyosin – a religious ceremony associated with the recitation of Surah Yasin from the Quran;

Sim is the old name of the city of Fergana;

Gavron - stick, stick and stick.

Students are given the task of paying attention to proverbs and aphorisms while listening to the topic and writing them down in a notebook.

Then, attention is paid to the phrases “the sky is far, the earth is hard,” “the thick stretches, the thin breaks.” Students try to interpret the meaning of the sentences.

The following are examples of students' responses:

1 – Proverb: used for people who are helpless. Sotibold was also a helpless, helpless person.

2 – Phrase: The rich are fat, the poor are thin; in difficult times, the rich become poor, and the poor, like Sotiboldi, are completely broken.

The ideas are summarized.

In the next stage of the consolidation part, the "Think" exercise is conducted, where the groups are given questions and tasks, and a time is set:

- From what details in the work did you learn that Sotiboldi's wife was young?
- What details show that Abduganiboy is cruel and stingy?
- Why didn't Sotiboldi take his wife to the hospital?
- What do you think about the doctor?
- What kind of person is Abduganiboy, why does Sotiboldi get paid so little?
- What does the sound of beggars outside have to do with the work?

(After listening to the students' answers, the sentences are completed and evaluated according to the level of the answer, using the evaluation criteria.)

The final stage of the reinforcement part is called “Attention! Problem!” The students are invited to debate by asking the following questions.

- Why is the work called "The Patient"?
- What do you think is the cure for the patient's illness?
- What would you name the story?

The groups engage in debate and discussion, trying to justify their opinions.

The answers are evaluated and interpreted based on the results.

At the end of the work, information is provided on the concept of the language of the given work of art:

During group activities, it is important not to confuse the three concepts related to language, but to distinguish between them.

These are: 1. National language. 2. Literary language. 3. Artistic language.

The universal language is understood to be the language used by all Uzbek speakers in our country, regardless of their region of residence, social class, occupation, and so on.

By *literary language* we mean the standardized form of the vernacular language in terms of lexical, grammatical, spelling, and pronunciation.

Artistic language, on the one hand, is a separate artistic phenomenon that relies on the national language and the literary language, and on the other hand, differs from both of them. The existence of artistic language is closely related to the activities of creators, poets, and writers. In this sense, artistic language has preserved the traditions of our national literature that have been formed over the centuries.

Each hero requires a unique approach, each heart is opened with a separate key. This key - his mood, character, speech, morality, worldview - works only with a unique depiction of dozens of elements. Only then, before the reader's eyes, the hero acts, speaks, laughs, thinks, suffers, rejoices, and falls into other states as if he were alive. Every action of the hero "infects" the reader, "taking" him into his world. So, not only Sotiboldi's wife, but also society is SICK.

Studying the story "The Thief" using the "cluster" method.

The "cluster" ("network") method helps students to study a topic in depth and make independent observations.

It encourages the expression of a concept or specific idea related to the topic freely and openly in the form of a drawing, connecting it with a sequence of events.

The cluster method is widely used in modern educational processes and produces effective results.

The word "cluster" means "bud, bundle", which helps students who are studying a topic think freely, helping them express their thoughts clearly. The sequence of creating a cluster was as follows:

- 1) a "keyword" or "key phrase" is written on the board;
 - 2) students are given the task of writing words or phrases that represent concepts related to this topic;
 - 3) It is emphasized that there should be interconnections between concepts and ideas related to the topic;
 - 4) Students are allowed to write all the options related to the topic they know.
- When forming a cluster, it is necessary to achieve the participation of all students in the class. Only then can the desired result be achieved, namely, activating students and making them not indifferent to the topic being studied.

Introducing the story "The Thief" and building understanding through working on the text;

To reinforce, first ask the groups their opinions by asking them general questions, which could be as follows:

- Let's pay attention to the title and epigraph of the story. Why were these names and epigraphs chosen? Is it possible to name it differently?
- Why exactly Cain? What do you think is the symbolic meaning of the name of the hero of the story?

The groups share their thoughts. Then the groups are given problem questions on cards and the group members try to agree on the answers:

"Perfect generation"

1. In which season do you think the story takes place? Justify your answer.
2. Explain the reason for the use of the phrase "Let the farmer's house burn down, but let his ox not be lost."

"Bright future"

1. Pay attention to the description of the condition of the grandfather Cain, why is he shaking?
2. Comment on the inspection of the captain of fifty.

"Stars of Thought"

1. Why do law enforcement officers themselves commit crimes, and why didn't Grandpa Cain take action against them?

2. What would be the condition of the cotton merchant?

Questions such as these are asked to small group participants and they are given 5-7 minutes to come up with answers to the questions in agreement with the group. After that, the assignment is checked based on the exercise "We check ourselves" and thoughts and expressions are written on the board.

1. The death of a horse is a celebration for a dog.

Let the farmer's house burn down, but don't lose his ox.

How many times do you have to throw a pot into water to get an ox?

The white king is captured if it has not been out of hand.

A cat doesn't go out into the sun for free.

A dry spoon tears your mouth.

One is too much for the giver, ten are too little for the taker.

Was it there before it disappeared?!

Was it a good ox or a bad ox?

Doesn't a good ox go away when someone leads it? Doesn't it come back on its own? Isn't it said that if someone takes it, it will return empty-handed?

The one who opens locks with the power of prayer.

The hair on top stood up.

Before you call it your back, your back will break.

Don't play with a man who will hit you with every blow.

Is one ox enough for one person?

Students are asked to analyze these expressions.

(Each group expresses their opinions on the general questions given to them. Their opinions are heard and supplemented.)

Studying the story "Horror" through discussion

The debate method is one of the advanced technologies used in schools and continuing education systems, and is a type of lesson that guides students to a deep understanding of the subject and sharpens their minds. As a result of students engaging in a debate about the subject and some painful point or problem in it, the pain of the work is transmitted to the student, disturbed, and directed. As a result,

they strive to solve these problems, look for the guilty or the heroic, and draw conclusions about the work. The advantage of the debate method, although it has been established for many years, is that through this method, all students directly participate in the lesson and the method covers the entire class.

During the discussion, the teacher should act as a guide to keep them on the right path and provide guidance to prevent them from drawing the wrong conclusions from the work.

Through discussion, it is desirable for students to find the ideological point of the work and draw conclusions about the idea the author is trying to convey.

Let's look at some topics for studying the work of Abdulla Qahhor. This is the story "The Teacher of Literature".

Studying the story "The Literature Teacher" based on the research method

In teaching literature, the research method, in guiding a gifted student to independent thinking, involves raising somewhat difficult theoretical issues in the learning process. This method requires the independent application of effective practical and research methods of education at a relatively advanced stage of knowledge acquisition.

In this, students perform practical work such as collecting evidence, theoretical analysis, systematization, generalization, and drawing scientific conclusions.

The difference between the research method and the heuristic method is that the "discovery" occurs in the process of practical work after the analysis of previously isolated materials, after the generalization of factual materials. In this case, the research task - the entire complex of educational and cognitive activities - is carried out by students themselves under the guidance of a teacher. That is, all the work, from collecting information to analyzing it and applying new knowledge in practice, is carried out by students independently.

The collection of factual materials by students is a necessary part of the research method. When using the research method, the completion of tasks by students is important. If any stage of the tasks is missed, the task loses its research value. The research method is used only when the level of development of students reaches a level where they can independently conduct research work, that is, when

they move to a higher stage of the educational process. In this case, the educational material should be restructured in the same way as it was structured in the heuristic method. The order of questions, instructions, and tasks is also the same. When using the research method, questions and tasks are set at the end of the stage, after most students have solved the problem. This is a method intended for strong students and is considered a method of self-control and verification in solving the problem. Students whose development is relatively slow are given tasks at their own level. Tasks are distributed according to the individual capabilities of each student. The research method can be used not only to study a new work, but also to consolidate it and at the stage of artistic analysis. The teacher only needs to correctly determine the methods that can be used, and correctly determine the content of the educational material that needs to be reinforced.

Let's get acquainted with the story "The Literature Teacher":

We will call the reinforcement part of the lesson "What kind of people will the students raised by Boqijon Bakayev be?" Pedagogical research work will be carried out on the basis of three groups. The groups will be given several questions for research and time will be set. During the allotted time, the groups will answer the questions in detail:

- What characteristics of Bakayev's character did you notice in connection with the tick in the cow's ear? What can be seen in his diverse views on pig farming?

- Based on Bakayev's statement to Hamida: "They wrote 'practicum' on the door of the chancellery. That's not true. Practicum, minimum, maximum - these are all Latin or Latin-like words," assess her level of education.

- What does it mean that Bakayev responded to Hamida's question about Chekhov's work with a question that seemed to fall from the roof?

- What do you think of the literature teacher's opinion that the question mark is always placed after "mi"?

- Bakayev has nothing to say: "If there is no barber, people will
He would become a monkey. The monkey shed its fur and became a man.
About this

Your reaction to Engels saying, "There is an idea..."

- What did you understand from Bakayev's ramblings about "bourgeois realism" after Hamida's novel?

- Compare literature teacher Bakayev with his wife Mukarram. Based on the couple's opinions about Chekhov, assess their level of education.

Students will focus on the questions separately for a specified period of time, and when the time is up, the question "What kind of people will the students raised by Boqijon Bakayev be?" will be memorized. Students will express their opinions based on their school life and other knowledge. Each student will find their own unique answer to the above research question. An oral question-and-answer exercise will be held on the topic discussed, and the topic discussed will be reinforced:

1. What kind of teacher does Boqijon Bakayev consider himself to be?
2. How did you understand that the cow would lick and deny its own opinion?
3. What kind of girl do you think Hamida is?
4. Is what he said about Latin words correct?
5. Is the opinion of Boqijon Bakayev conveyed to Hamida's domla Hakimov correct?
6. What do you think about the literature teacher not knowing Chekhov?
7. What is your reaction to Boqijon Bakayev getting into an awkward situation and immediately correcting the situation?
8. Was Hamida able to answer the question she asked about the story "The Desire for Sleep"?

The students summarize their thoughts, and the teacher expresses his opinion. They share conclusions. Through the story "The Teacher of Literature", students will be exposed to the nature of Bakayev's teaching and the tragedy of the fate of the students, Bakayev's personality will be revealed. They will learn that he has no knowledge in his field. It would be appropriate to assign a homework assignment to write an essay on the topic "The Teacher I Dreamed of" as a homework assignment. The above work is a (business) games, research-oriented exercises, advice real estate. All the top tips are for the purpose of the activity. suitable participants based on a dialogical dialogue to encourage and support them their interests to increase, to increase the emotional. It serves the purpose of creation.

Purposeful educational, didactic in the lesson process games learning objectives and to them mo slash t i ringan For example , didactic games from the system one of the first , preschool education system in the process useful work circle F.Fr i bi l and M.Monti 's works What is it ? be , empty space education for him / her Oh. D -Ivory research papers He took it. 6 0 - 70 from years start only starting point in education it's not , it 's okay maybe average education yes useful It 's empty . In the 80s especially, business (business) games in some places what is it It has spread and many teachers have put into practice the ways of using it effectively in the classroom . Business (entrepreneurship) play games main specialty The game plan is important because it is focused on the learning goal and inspires the student to new inventions and discoveries. In this case , the learning goal is implemented within the framework of the gmtasks .

2. A sample plan is provided in the appendix below.

Table 3.4. Topics planned for master classes and allocated hours (total 34 hours)

Tr	Topics	Training hour	Transfer time	Responsible	Note
1st quarter 9 hours					
1	Word art The living expression of each nation's existence in the world is its national language and literature.	1	As a club activity		
2	The role of fiction in personal development	1	As a club activity		
3	About the work of art	1	As a club activity		
4	Fiction is the main characteristic of literature	1	As a club activity		
5	Literature and ideology	1	As a club activity		

6	Content of the work of art	1	As a club activity		
7	The concept of form and content in a work of art	1	As a club activity		
8	The plot of a work of art	1	As a club activity		
9	Modern scientific approaches and innovations in the digital economy	1	As a club activity		
2nd quarter 7 hours					
1	Artistic image and imagery (in Uzbek novels)	1	As a club activity		
2	Language of the work of art	1	As a club activity		
3	Artistic images and means of expression	1	As a club activity		
4	Artistic skill (prose)	1	As a club activity		
5	Artistic skill (poetry)	1	As a club activity		
6	About the lyrical genre and its genres	1	As a club activity		
7	Automate the language learning process	1	As a club activity		
3rd quarter 11 hours					
1	Rhythm is the foundation of poetry.	1	As a club activity		
2	Meter as a rhythmic phenomenon in poetry	1	As a club activity		
3	Landscape. Landscape lyrics	1	As a club activity		
4	Imagery in poetic genres	1	As a club activity		
5	The writer's word skills	1	As a club activity		
6	The poetics of Jadid poetry	1	As a club activity		

7	The idea of national independence in Jadid poetry	1	As a club activity		
8	Epic type and its genres	1	As a club activity		
9	Artistic speech-character creation tool	1	As a club activity		
10	Poetics of a work of art	1	As a club activity		
11	Criteria for creating an information-computer style of the Uzbek language	1	As a club activity		
Fourth quarter					
28	Abdulla Qodiriy, the first novelist	1	As a club activity		
29	The skill of creating a literary portrait	1	As a club activity		
30	About the dramatic tour	1	As a club activity		
31	The difference between comedy and tragedy	1	As a club activity		
32	The current literary process	1	As a club activity		
33	Issues of media coverage and publication of creative samples	1	As a club activity		
34	The importance of social media in illuminating the creative process	1	As a club activity		

2.
